

User's Manual

MULTI-LOOP MODULE TYPE TEMPERATURE CONTROLLER **<Enhanced Communication Module (CC-Link)>**

TYPE: PUMCL

Please Read First (Safety Warnings)

Please read this section thoroughly before using and observe the mentioned safety warnings fully.

Safety warnings are categorized as "Warning" or "Caution".

△Caution	Improper use of the equipment may result in death or serious injuries.
△Warning	Improper use of the equipment may cause injury to the user or property damage.

⚠ Warning

Installation and Wiring

- This equipment is intended to be used under the following conditions.

Ambient temperature	-10 to 50 degree C
Ambient humidity	90% RH or below (with no condensation)
Vibration	10 to 70Hz less than 9.8m/s ² (1G)
Warm-up time	30 min. or more
Installation category	IEC1010-1: class II
Pollution level	IEC1010-1: degree 2

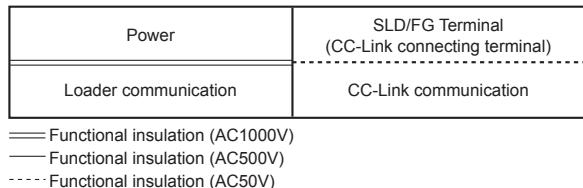

- Between the temperature sensor and the location where the voltage reaches or generates the values described below, secure clearance space and creepage distance as shown in the table below.

If such space cannot be secured, the EN61010 safety compliance may become invalid.

Voltage used or generated by any assemblies	Clearance Space [mm]	Creepage Space [mm]
Up to 50 Vrms or Vdc	0.2	1.2
Up to 100 Vrms or Vdc	0.2	1.4
Up to 150 Vrms or Vdc	0.5	1.6
Up to 300 Vrms or Vdc	1.5	3.0
Above 300 Vrms or Vdc	Please consult our distributor	

- For the above, if voltage exceeds 50Vdc (called danger voltage), basic insulation is required between the earth and all terminals of the equipment.

Note that the insulation class for this equipment is as follows. Before installing, please confirm that the insulation class for equipment meets usage requirements.

- In cases where damage or problems with this equipment may lead to serious accidents, install appropriate external protective circuits.
- To prevent damage and failure of the equipment, provide the rated power voltage.
- To prevent electric shock and equipment failure, do not turn the power ON until all wiring is complete.
- Before turning the power ON, confirm that clearance space has been secured to prevent shock or fire.
- Do not touch the terminal while the machine is ON. Doing so risks shock or equipment errors.
- Never disassemble, convert, modify or repair this equipment. Doing so risks abnormal operation, shock or fire.

Maintenance

- When installing or removing the equipment, turn the power OFF. Otherwise, shock, operational errors or failures may be caused.
- Periodic maintenance is recommended for continuous and safe use of this equipment.
- Some parts installed on this equipment have a limited life and/or may deteriorate with age.
- The warranty period for this unit (including accessories) is one year, if the product is used properly.

⚠ Caution

Cautions when Installing

Please avoid installing in the following locations.

- Locations in which the ambient temperature falls outside the range of 0 to 50 degrees C when equipment is in use.
- Locations in which the ambient humidity falls outside the range of 45 to 85% RH when equipment is in use.
- Locations with rapid temperature changes, leading to dew condensation.
- Locations with corrosive gases (especially sulfide gas, ammonia, etc.) or flammable gases.
- Locations with vibration or shock directly.

- Locations in contact with water, oil, chemicals, steam or hot water.
(If the equipment gets wet, there is a risk of electric shock or fire, so have it inspected by Fuji distributor.)
- Locations with high concentrations of atmospheric dust, salt or iron particles.
- Locations with large inductive interference, resulting in static electricity, magnetic fields or noise.
- Locations in direct sunlight.
- Locations that build up heat from radiant heat sources, etc.

Cautions when Mounting to Cabinets / DIN Rails

- In case of mounting the temperature controllers to DIN rails, remember to push up the locking tabs to fasten the controllers onto DIN rail.
- To connect controllers, first release all locking tabs. Then, connect controllers and push up all locking tabs. Make sure that all locking tabs are fastened.
- Never fail to turn the power OFF, before detaching the terminal block or removing the main unit from the base part.
- In order to aid heat dissipation, do not block the top and the bottom of the equipment.
- When mounting / dismounting controllers to / from DIN rails, 30mm of clearance above and under the controllers should be provided.

Cautions for Wiring

- To comply with CE marking (EMC), we recommend to attach ferrite core to communication cable and power cable.
- For wiring to the terminal block, apply crimp type terminals size M3.

Use terminal screws in this product only.

Screw size: M3×7 (with square washer)

Screw tightening torque: 0.78N·m (8kgf·cm)

- To avoid the influence of inductive noise, input signal wires should be separated from electric power lines or load lines.

Error Operation

- The alarm function does not work properly when an error occurs unless the settings are made correctly. Always verify its setting before operation.

Others

- Please do not wipe the equipment with organic solvents such as alcohol or benzene, etc. If wiping is necessary, use a neutral cleaning agent.
- Do not use mobile phones near this equipment (within 50cm). Otherwise a malfunction may result.
- Malfunctions may occur if the equipment is used near a radio, TV, or wireless device.
- This equipment requires approx. 20 seconds before it starts to output.
- Before installing and wiring, take necessary measures for electrostatic discharge (ESD).
- The power supply for this product is 24V DC. Please use the power source of appropriate volume depending on the number of units you connect.

Recommended power supply :

Cosel Electronics Co., Ltd. PBA Series

Omron Corporation S8VM Series

1.1 Overview

1.1 Overview

Enhanced communication module, PUMCL, is a module to perform communications with each company's PLC, which is CC-Link compliant.

- This PUMCL is used when you make up the temperature control system with the module-type temperature controller, PUM series and to perform communications with using CC-Link.
- The communication functions comply with the MODBUS RTU just like the other modules of PUM series.
- Labor saving wiring ; with only one unit directly connected to power supply, all connected controllers are also connected to it internally via side connectors.

Hereinafter, PUMCL will be referred to as "this equipment" or "enhanced communication module".

Confirming accessories

Before using the product, please confirm that all of following accessories are included.

Description	Quantity
Temperature Controller Enhanced Communication Module	1 unit
Instruction manual (Installation)	1 copy

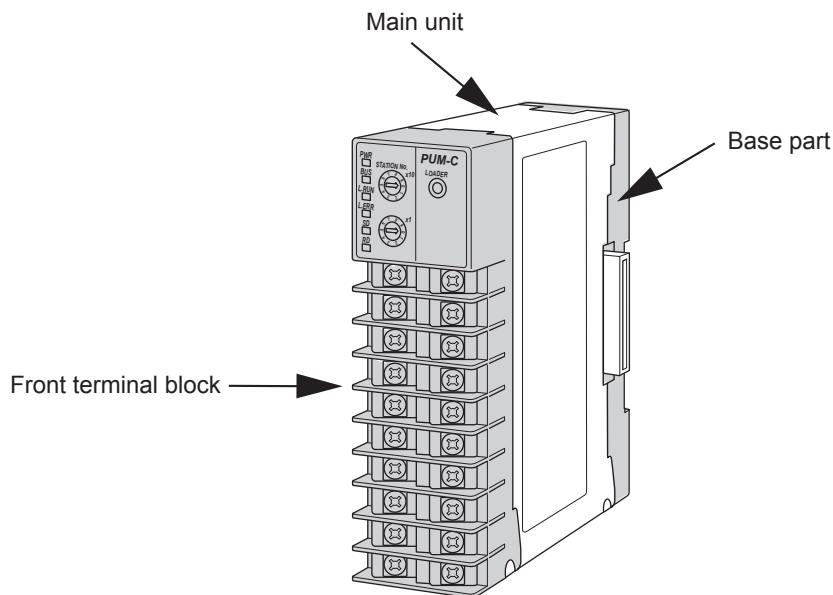

1.2 Model Code

Enhanced communication module

Accessories (Option)

1.3 Part Names and Functions

External view

Front terminal block

The front terminal block is equipped with loader communication port, CC-Link station No. configuration switch, and LED indicator lamps.

- Removable from the main body without tools in seconds.

Main unit

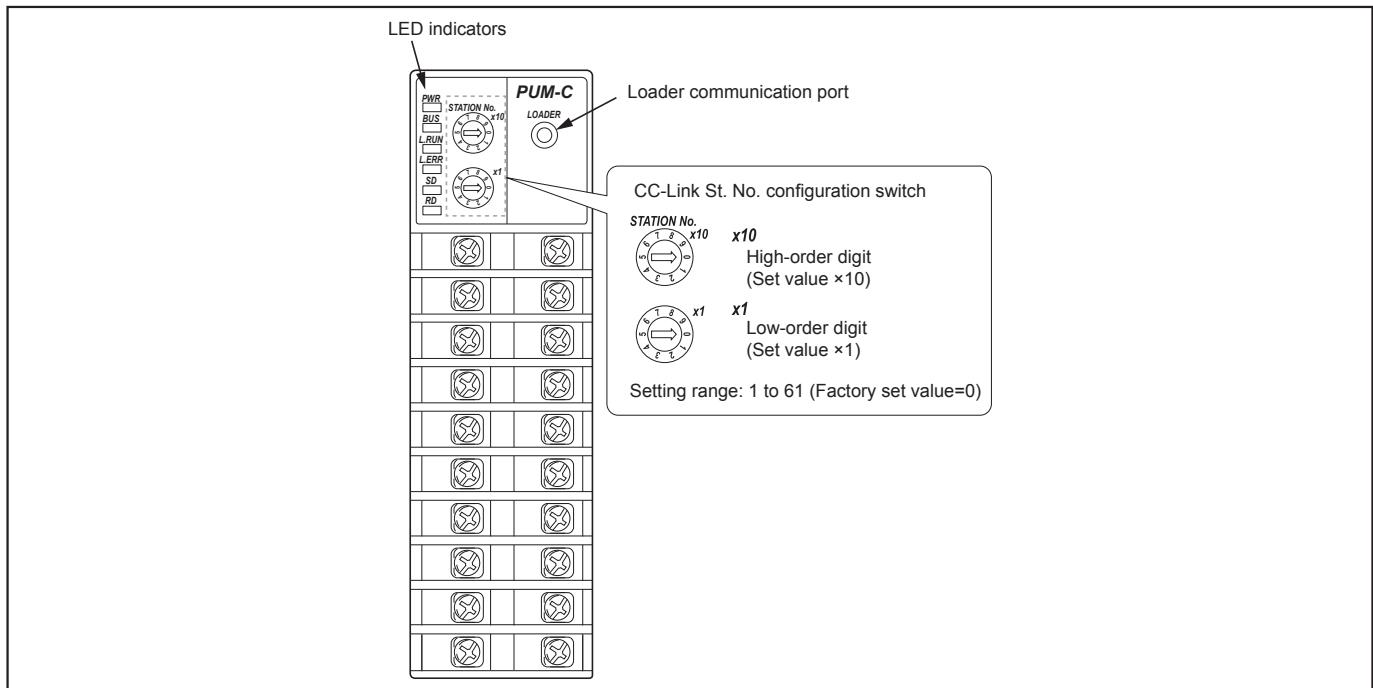

The main unit is the controller with circuit for CC-Link communications.

- The main unit can be removed from the base part without tools in seconds.
- The main unit is equipped with the CC-Link communication speed configuration switch and number of stations occupied/extended cyclic configuration switch on the back face (on the side of base part).

Base part

The base part incorporates power terminal, connectors for connecting modules laterally, and the structure for mounting modules onto a DIN-rail.

Front terminal block

LED indicators

LED lamps indicate the operation status below.

LED	Green	Red	Orange
PWR	(Order of priority) OFF: Power OFF Green blinking (0.4-sec interspace): 1) No unit detected by initial polling 2) Inter-module communication error occurred after initial polling Green blinking (0.1-sec interspace): During initial polling Green lamp ON: In operation	—	—
BUS	On: In reception of inter-module communications	—	In transmit of inter-module communications
L.RUN	ON: In execution of data link OFF: In reset H/W or data link has unexecuted	—	—
L.ERR	—	ON: Communication error (CRC error, St. No. setting error, communication speed setting error) OFF: In normal reception or reset H/W Blinking: Set the switches when the power is on	—
SD	ON: In transmit of CC-Link data	—	—
RD	ON: In reception of CC-Link data	—	—

Loader communication port

Loader communication port is an interface to connect PUM with a PC with parameter loader software installed using an optional loader connecting cable.

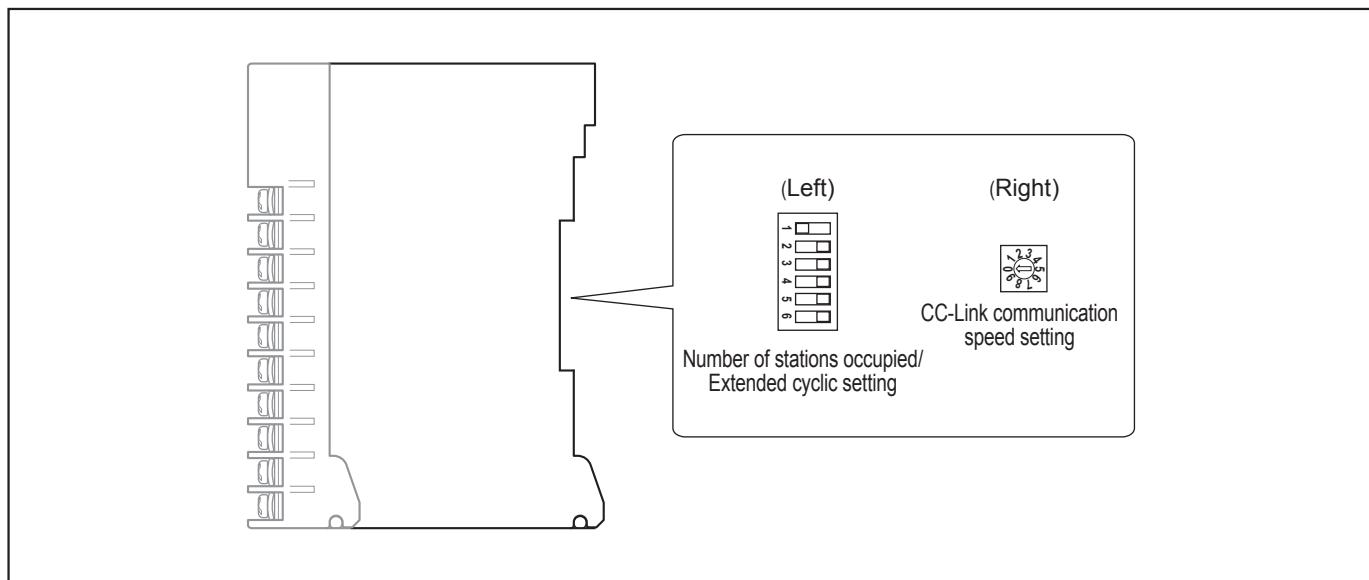

CC-Link station number configuration switch

Set the CC-Link station numbers (1 to 61) for this equipment.

Note

- CC-Link communications is not available when the station number is 0 (Factory set value). Make sure to set the station number.
- Station number selection error occurs and the red L.ERR indicator lamp will ON, if you set the value of “0” or larger than “62”.

Main unit (Back face)

CC-Link communication speed setting switch

Configure communication speed for CC-Link by the station number configuration switch.

Communication speed and maximum transmission distance (when using a ver.1.10 compliant CC-Link special cable)

Communication speed setting	Communication speed	Maximum transmission distance (Max. length of network)
0	156kbps	1200m
1	625kbps	900m
2	2.5Mbps	400m
3	5Mbps	160m
4	10Mbps	100m

Note

If "5" to "9" is selected, communication speed selection error occurs and the red LED lamp, "L.ERR", will turn on.

Number of stations occupied/Extended cyclic setting switch

Number of stations occupied and extended cyclic can be set by DIP switch.

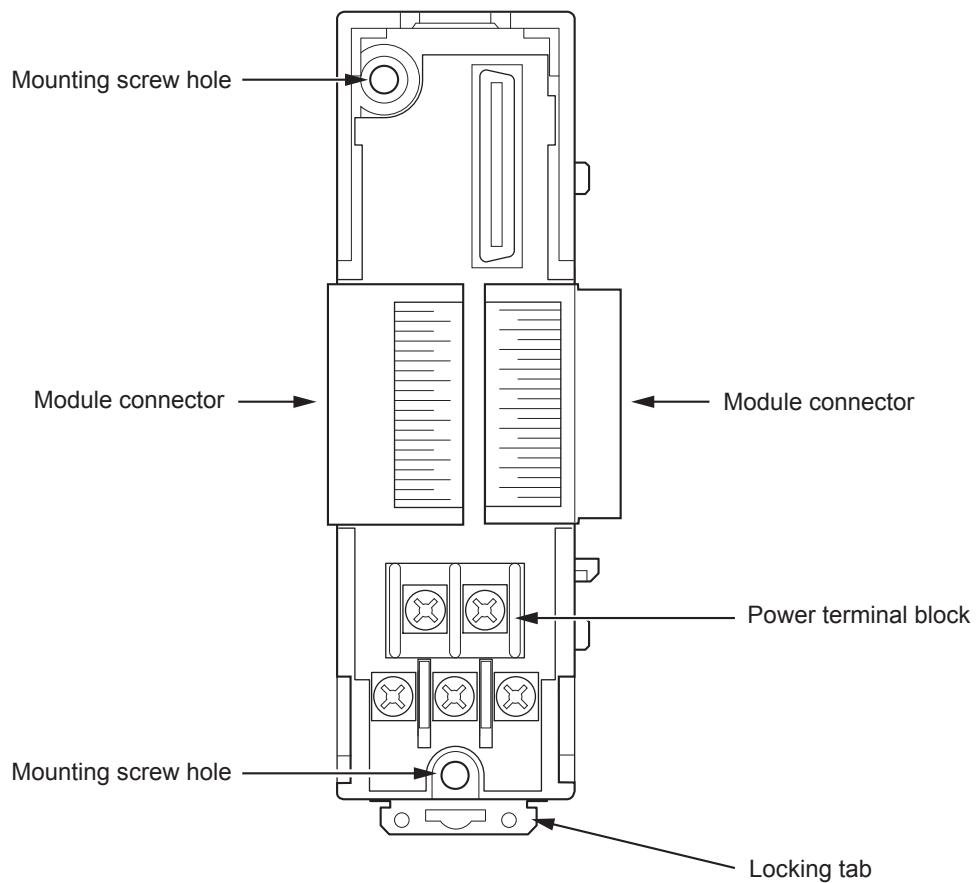

Number of stations occupied / Extended cyclic setting

SW1	SW2	SW3	SW4	Number of stations occupied/Extended cyclic setting (Number of channels)	Compliant version
OFF	OFF	OFF	OFF	4 stations occupied ×1 (8Ch)	Ver.1
ON	OFF	OFF	OFF	4 stations occupied ×1 (16Ch)	
OFF	ON	OFF	OFF	4 stations occupied ×2 (16Ch)	Ver.2
ON	ON	OFF	OFF	4 stations occupied ×2 (32Ch)	
OFF	OFF	ON	OFF	4 stations occupied ×4 (32Ch)	
ON	OFF	ON	OFF	4 stations occupied ×4 (64Ch)	

Note

"4 stations occupied ×1(8 Ch)" will be set, if the setting other than the table above is set to DIP switch.

Base part

Module connector

Module connectors connect controllers laterally.

Power terminal block

Power terminal block connects to the power supply of module.

If any one of connected controllers is directly connected with power supply, power will be provided to all of controllers via side connectors.

Locking tab

Locking tab fastens a controller onto DIN rail when mounting controllers to a DIN rail. Locking tabs also fasten controllers each other.

2

System Configuration Example

2.1 System Configuration Example 2-3

1 Overview

2 System Configuration Example

3 Installation

4 Enhanced Communication Function Setting

5 Communication Devices

6 Troubleshooting

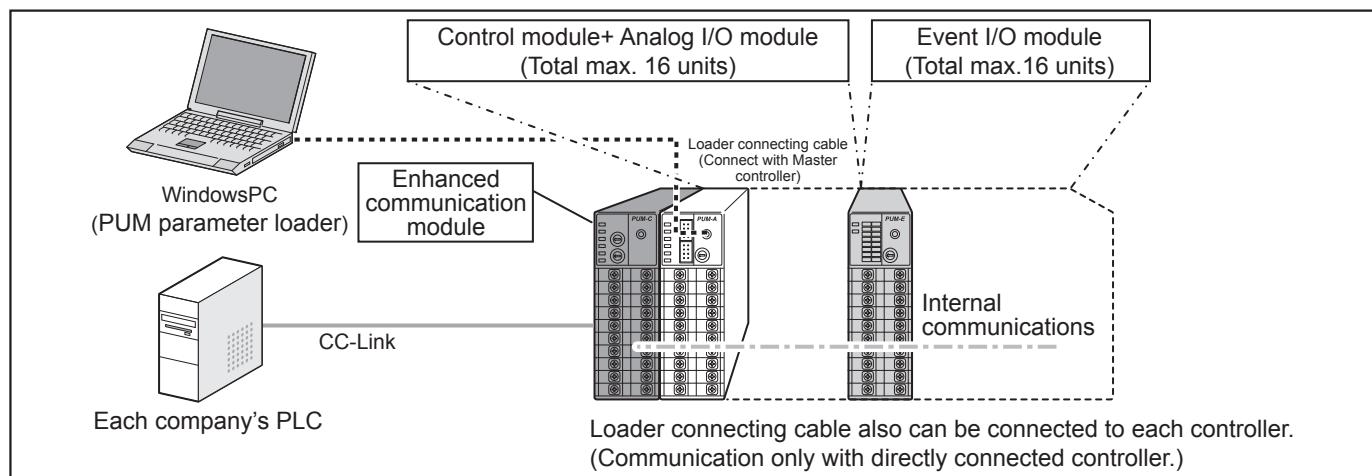

2.1 System Configuration Example

2.1 System Configuration Example

The followings are examples of a temperature controller system added this equipment to multi-loop module type temperature controller PUM series.

System configuration using the enhanced communication module

- By adding the enhanced communication module to the system, communication with each company's PLC via CC-Link is available.

Point

- Station number of the control/analog I/O module (1 to 16)

In order to perform communication correctly, station number setting is required. Set the leftmost controller to "1". Number the rest of controllers consecutively as "2", "3","16". Make sure that there is no duplicate station number in the same system.

- Station number of event I/O module (17 to 32)

The station number of event I/O module must start with "17". Number the rest of controllers consecutively as "18", "19","32". Make sure that there is no duplicate station number in the same system.

Basic setting items

In case of this example, the following settings are required.

- Station number setting ➡ 3-10
- RS-485 communication setting ➡ Control module user's manual
- CC-Link communication setting ➡ 4-3

Point

In order to use an enhanced communication module, set the enhance communication module communication permission for the control module, analog I/O module, and event I/O module to "1: PUMCL connected (RS-485 Disable)".

Note

Only PUMA/B (control module) can be accessed from the host PLC via CC-Link communication.

2.1 System Configuration Example

3

Installation

3.1	Installation Procedure	3-3
3.2	Dimensions	3-5
3.3	Mounting to DIN rail	3-6
3.4	Attaching Accessories (Optional)	3-11
3.5	Mounting with Screws	3-12
3.6	Connection	3-13

3.1 Installation Procedure

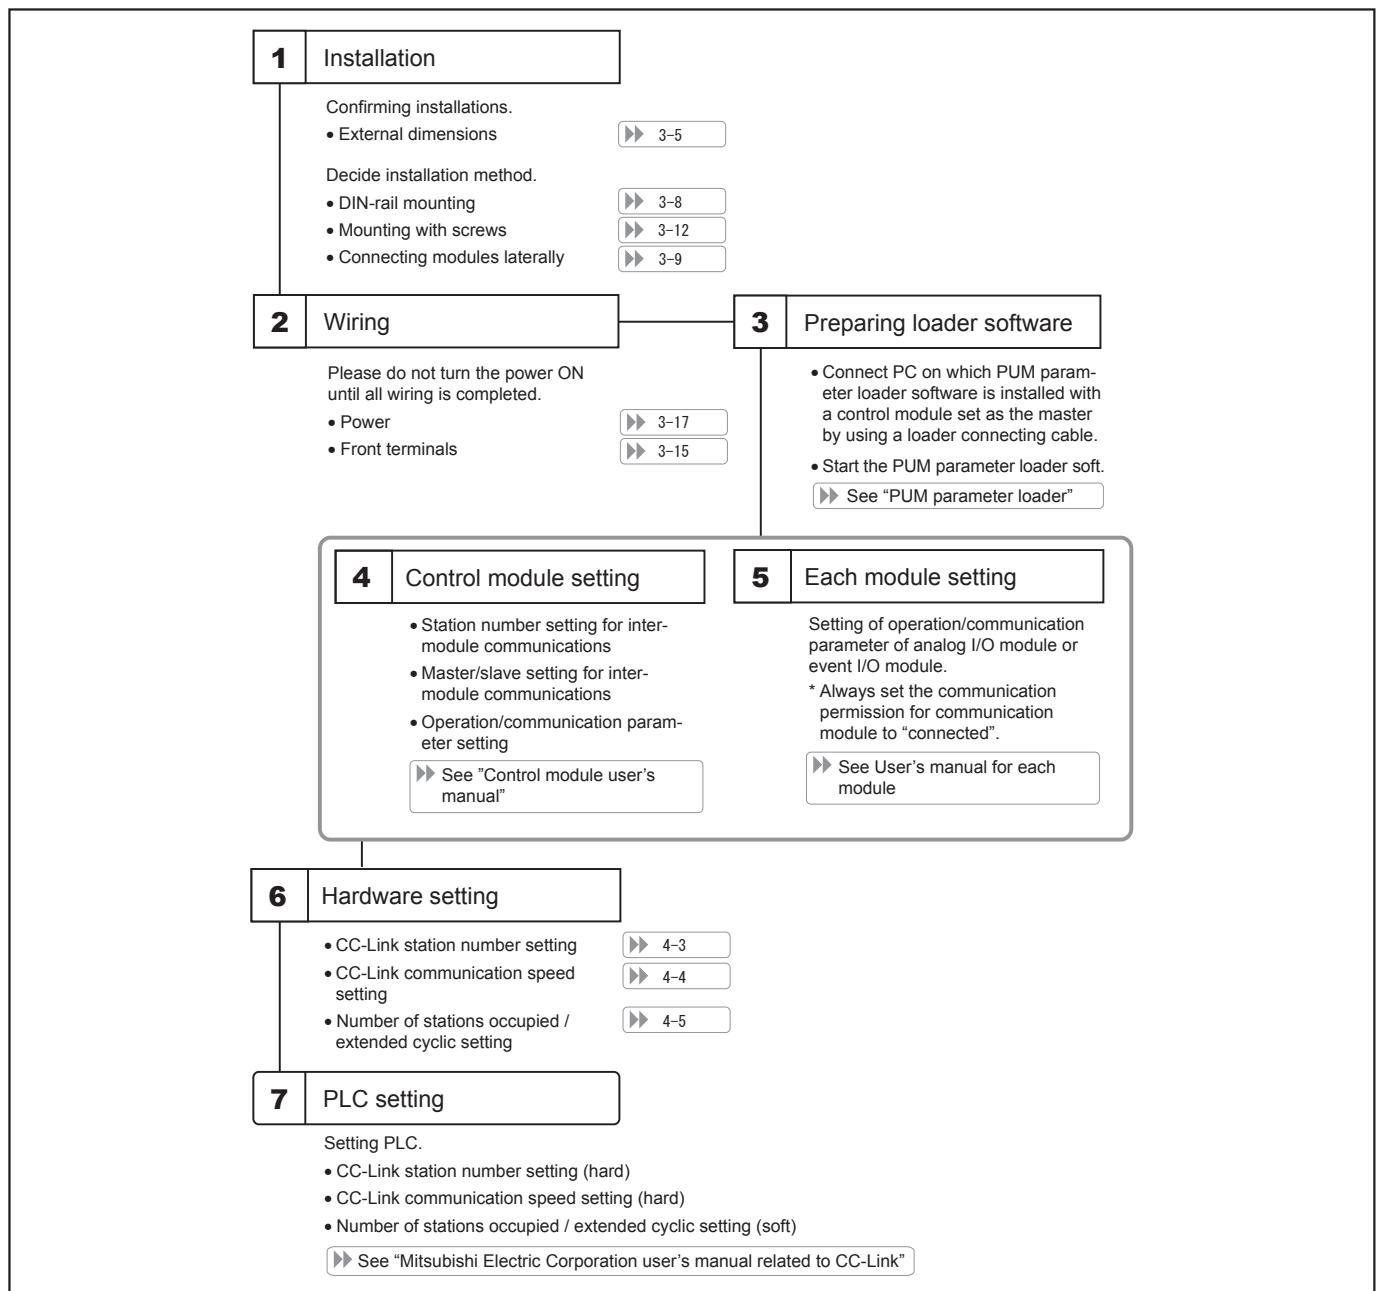

3.1 Installation Procedure

The procedures from installation to startup via PUM parameter loader software are shown below.

Then, the procedures of communication setting of host equipment and trial run are shown.

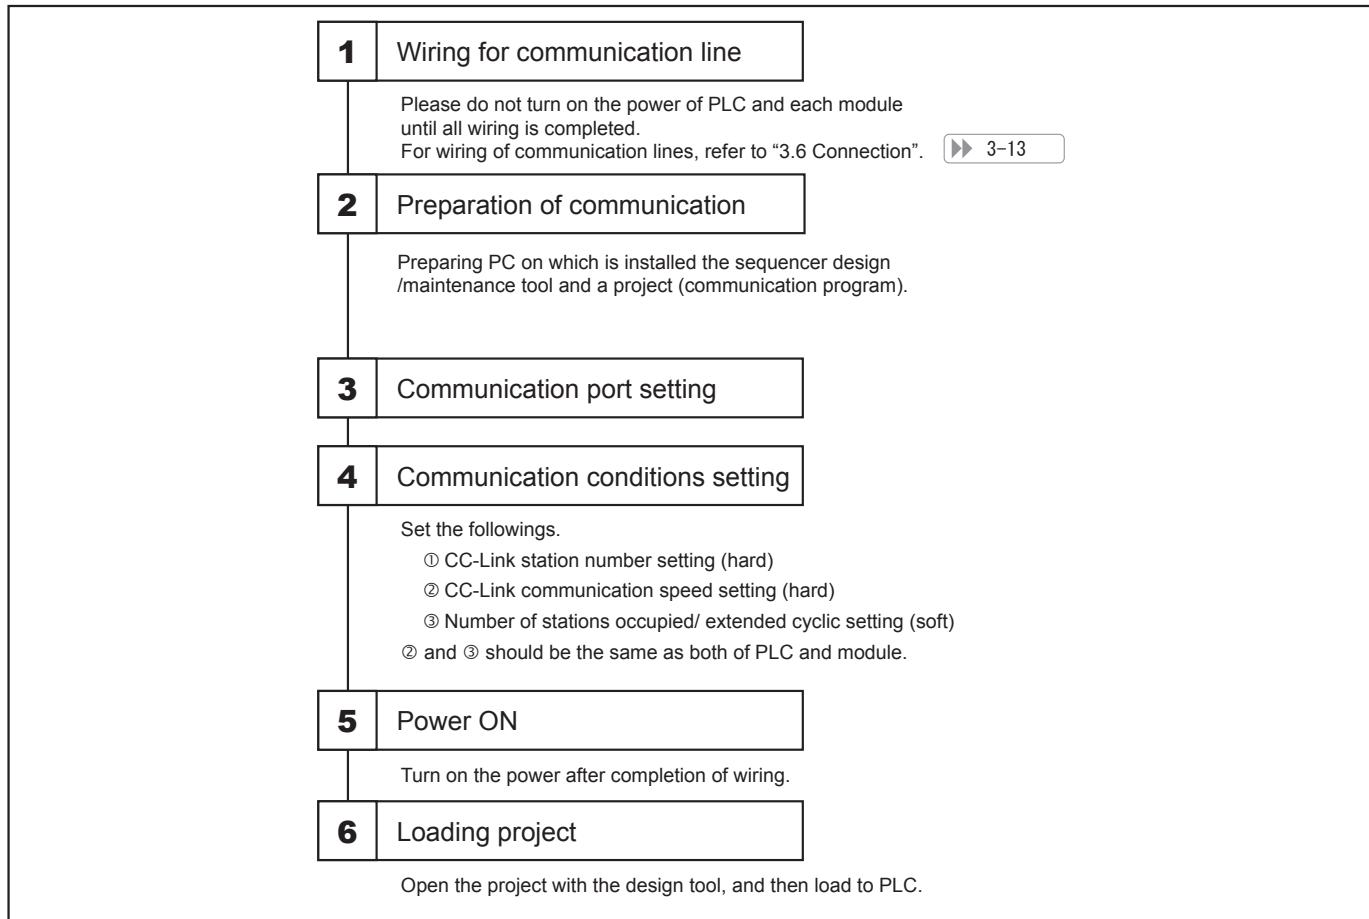

PUM setting and installation

- Communication permission for the enhanced communication module should be set to “Connected” on the all modules of the system.
- If connected PUM parameter loader to the master module, other module’s setting can also be made at the same time.
- Setting of the station number (CC-Link station number) for the enhanced communication module is necessary.

CC-Link master (PLC) setting

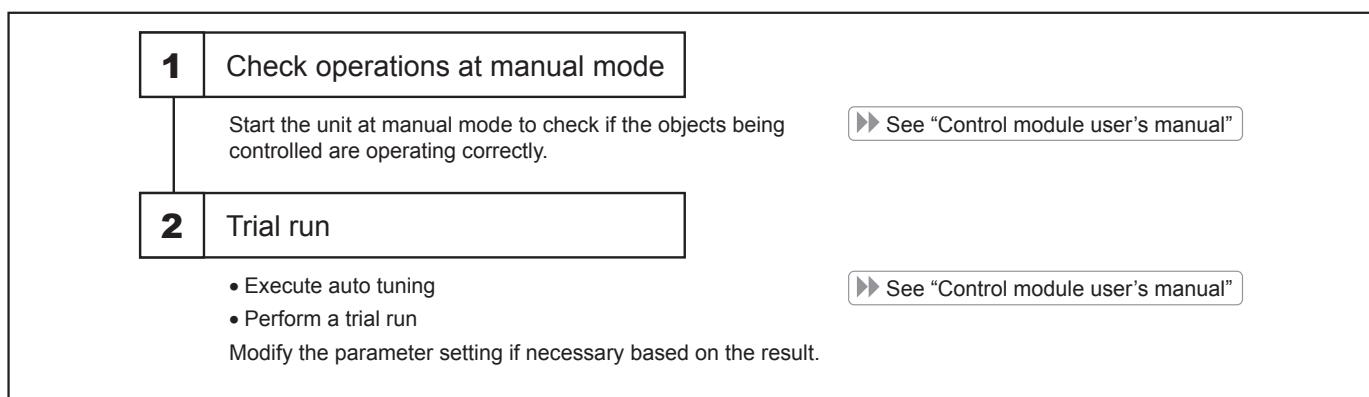

- Setting of the host equipment (PLC) and this equipment should be the same in order to perform communication.
- Turn OFF the each module's power when wiring.

Trial Run

Control trial

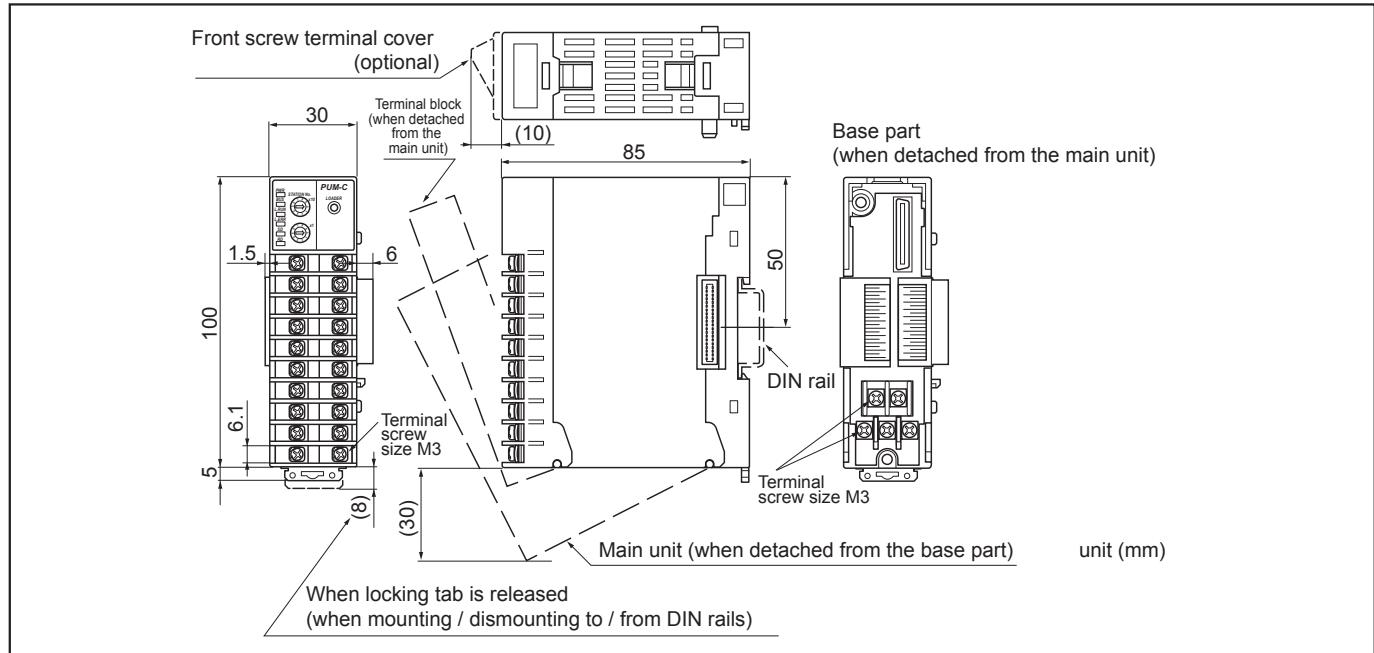

Check that the system can control the objects correctly.

3.2 Dimensions

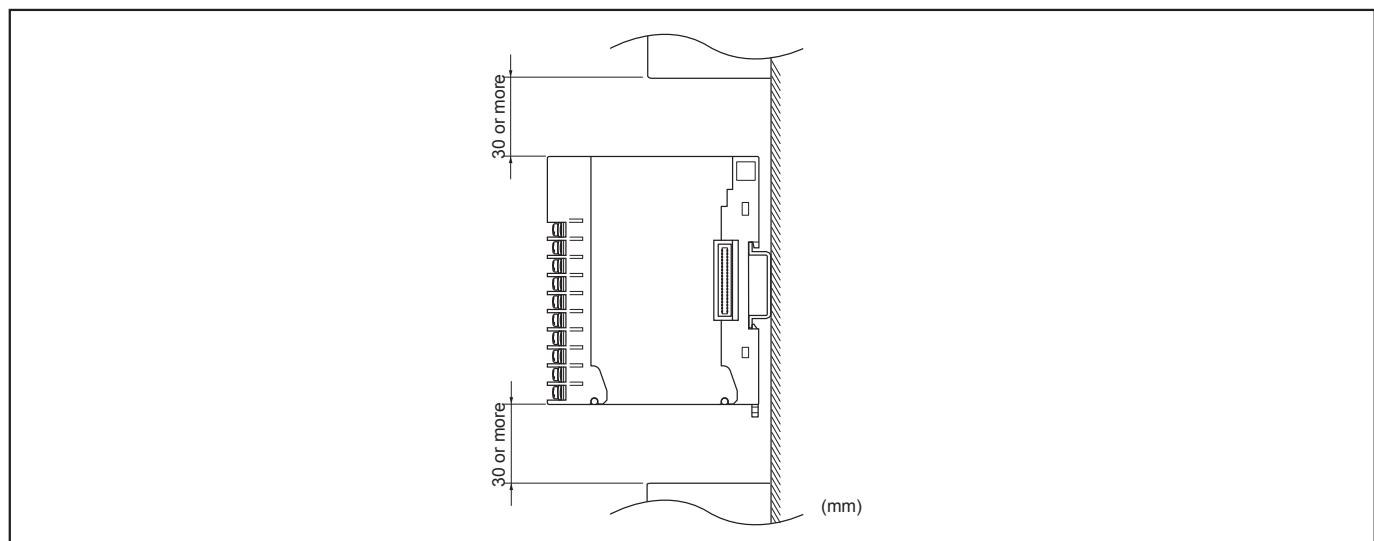

Dimensions

Refer to the dimensions shown below and provide enough clearance space when install controllers.

Cautions when mounting

In order to aid heat dissipation, 30mm of clearance (50mm recommended) above and under the controllers should be provided.

Point

When mounting / dismounting controllers to / from DIN rails, 30mm of clearance above and under the controllers should be provided.

3.3 Mounting to DIN rail

How to Remove Front Terminal Block / Base Part from the Main Unit

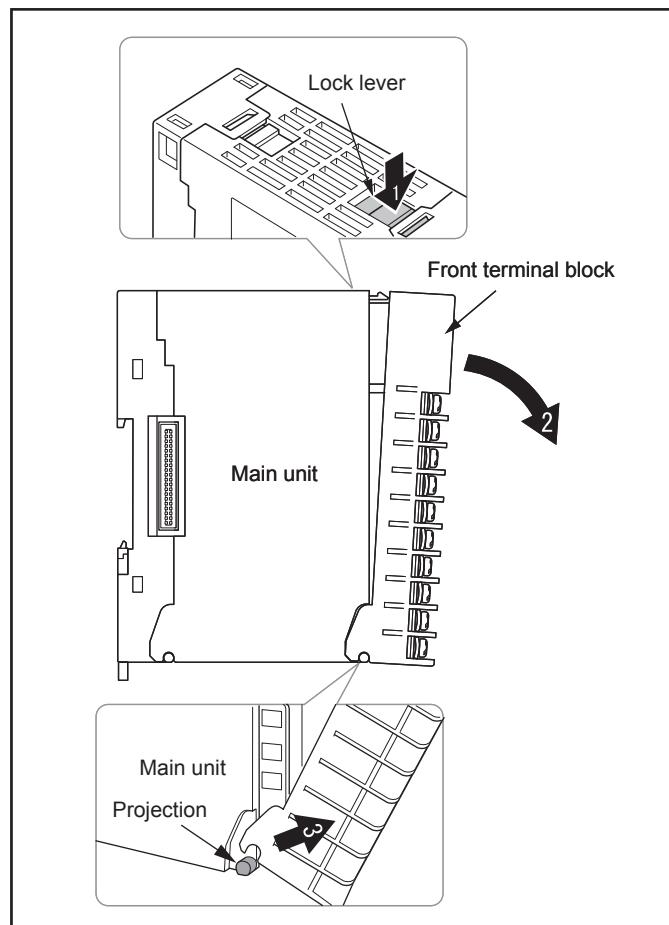

Front terminal block and base part of this equipment are removable from the main unit without tools in seconds, which enables easy mounting and maintenance.

How to remove front terminal block

1. Press the lock lever on the top of the main unit.
2. Pull down the front terminal block.
3. Detach the cutout on the lower end of the front terminal block from the projection on the main unit.

Point

- When attaching the front terminal block to the main unit, take the reverse procedure to remove the front terminal block from the main unit.
- Make sure that the lock lever of the main unit is fitted into the front terminal block.

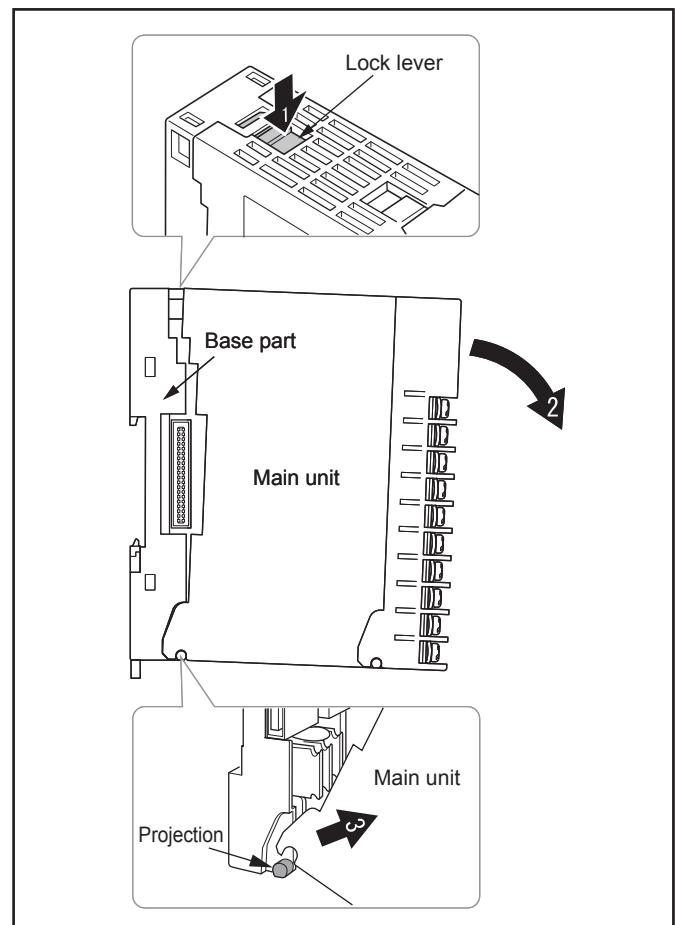

How to remove base part

1. Press the lock lever on the top of the main unit.
2. Pull down the upper part of main unit.
3. Detach the cutout on the lower end of back of main unit from the projection on the base part.

Point

- When attaching the base part to the main unit, take the reverse procedure to removing the base part from the main unit.
- Make sure that the lock lever of the main unit is fitted into the base part.

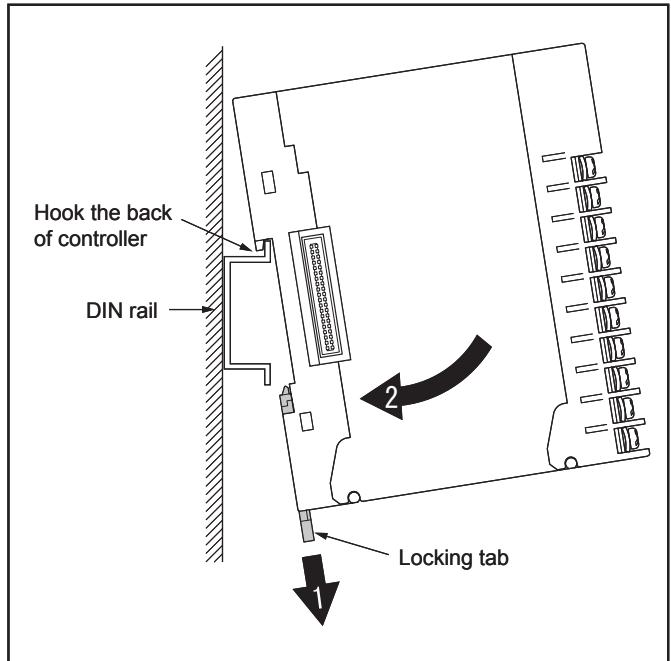

Mounting to DIN Rails

Mount controllers

1. Pull down the locking tab of the base part.

Hook the back of the controller onto the upper part of DIN rail.

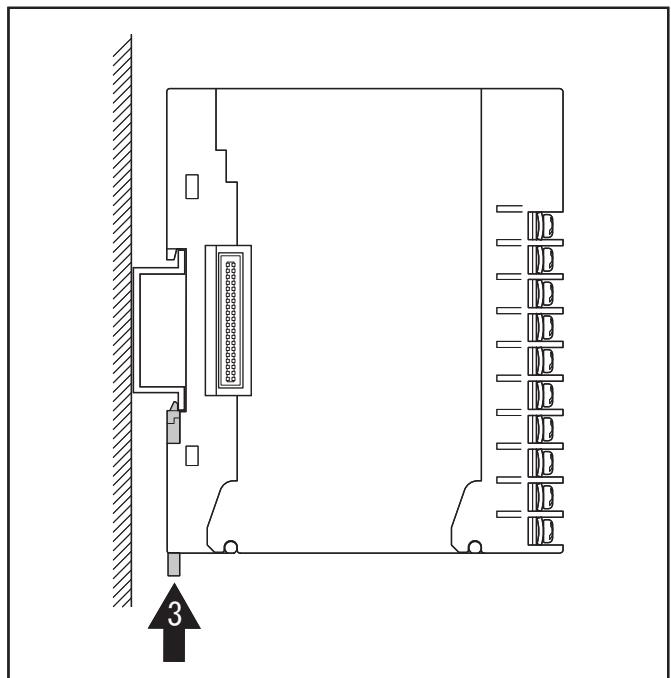

2. Push the controller in the direction of arrow 2.

3. Push up the locking tab to fasten the controller onto DIN rail.

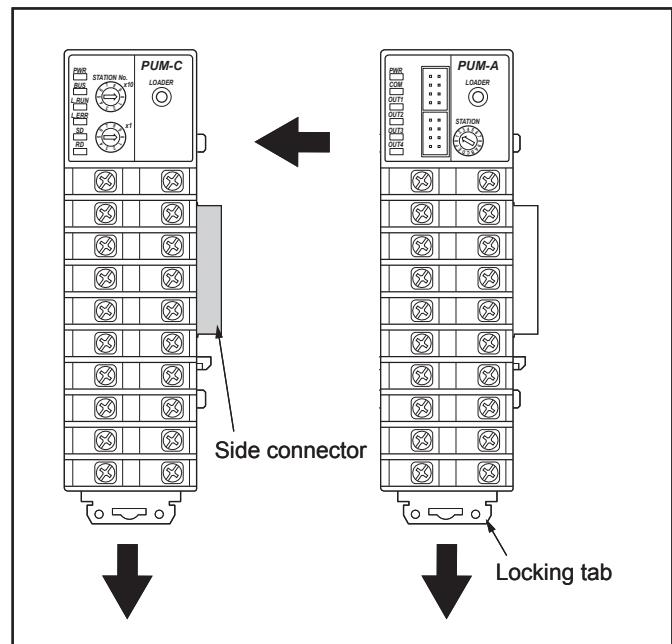

Point

When connecting controllers after mounting to DIN rail, push up the locking tab after doing so.

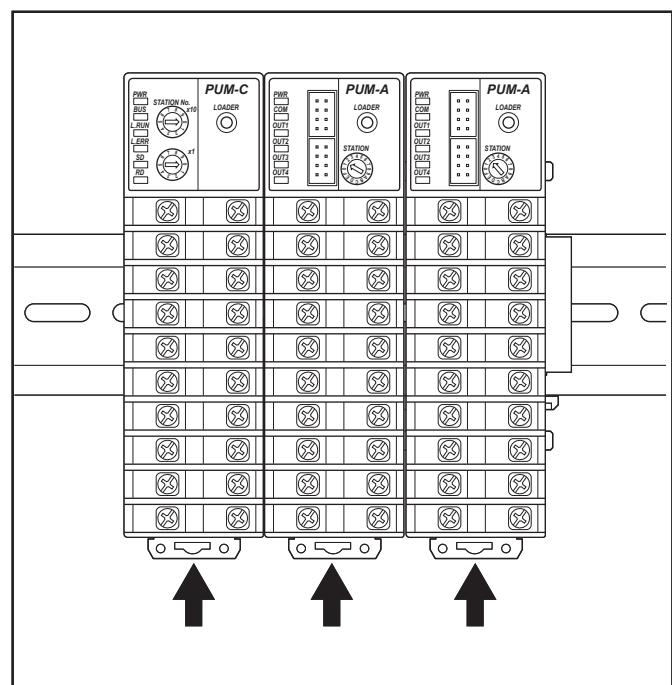

Connecting controllers

1. Check that locking tabs are pulled down (released).
2. Connect controllers with each other using side connectors.

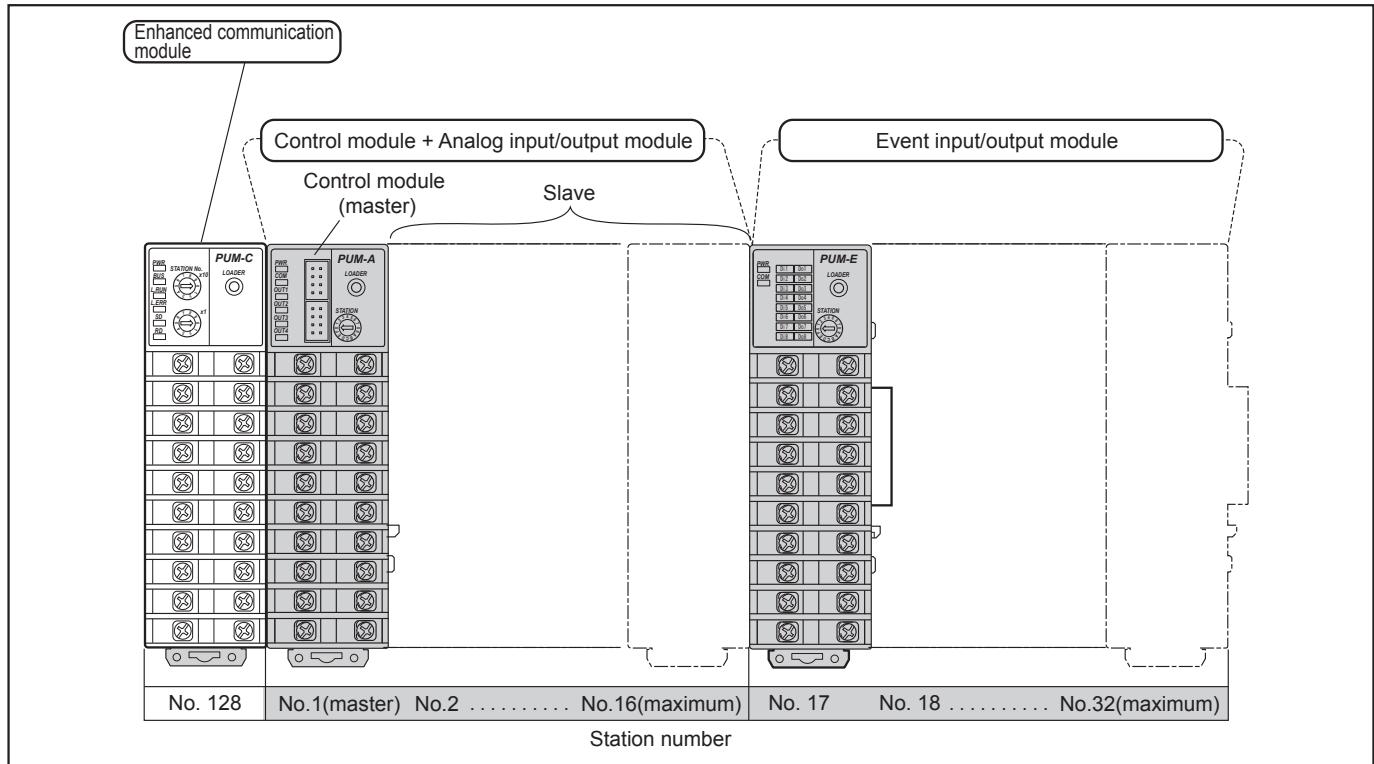

3. After mounting connected controllers onto DIN rail, make sure to push up all locking tabs. Controllers are fastened to DIN rail and to each other.
4. All connected controllers are connected to power supply via side connectors if one of controllers is directly connected to them.

Order of Controllers

PUM series module type temperature controllers should be connected in the order shown below.

Point

Enhanced communication module should be placed on the left end.

- Enhanced communication module should be placed on the left side of the master control module. It means enhanced communication module is always placed on the left end.

Basically, connect modules in order of the station number from the left.

- Assign station numbers 1 to 16 to control module and analog input/output module. Maximum 16units in total can be connected. Make sure that there is no duplicate station number in the same system.
- When setting slave or master, set the control module of station No.1 as the master controller. The master controller should be on the extreme left if an enhanced communication module is not used.
- Assign station numbers 17 to 32 to event input/output module. Maximum 16units can be connected. Make sure that there is no duplicate station number in the same system.

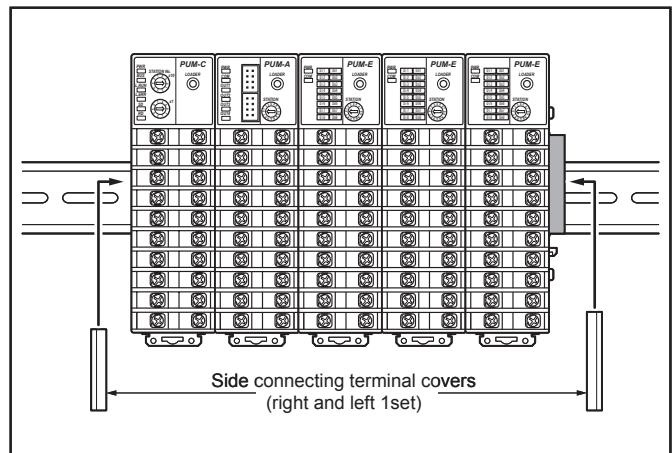

Note

Only PUMA/B (control module) can be accessed from the host PLC via CC-Link communication.

3.4 Attaching Accessories (Optional)

Attaching Side Connecting Terminal Covers

Side connectors on the both ends of connected controllers are exposed. To prevent accidents and to protect them, we recommend to attach side connecting terminal covers (PUMZ*A03) to the ends of the rightmost and leftmost controllers.

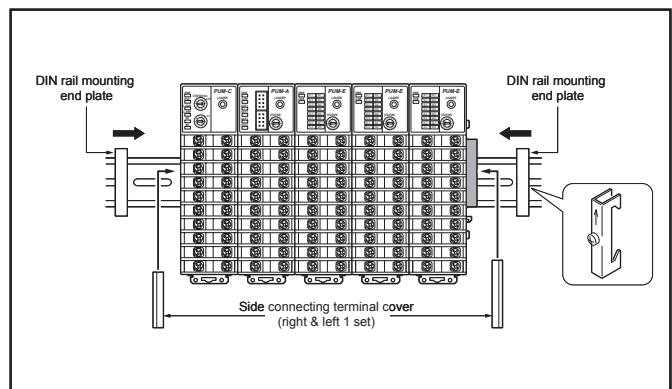

Attaching End Plates

In order to secure controllers onto DIN rail more tightly, end plates (PUMZ*A02) are also available.

Note

When attaching end plates, make sure to attach side connecting terminal covers first.

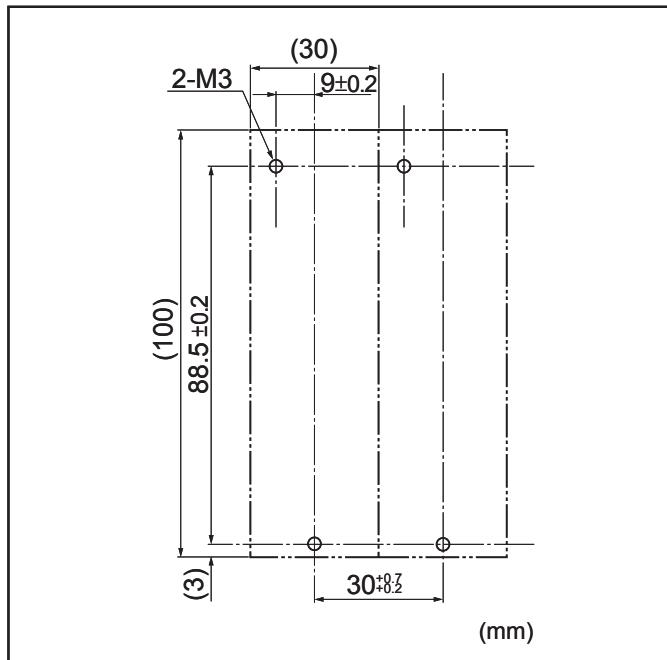

3.5 Mounting with Screws

When mounting controllers with screws inside a cabinet, check the screw hole size of the base part and the mounting position beforehand.

Point

- Mounting screws are not included in the product. Prepare two M3 screws per unit.

- Refer to the right figure for the mounting screw hole size and the pitch to decide the mounting position.

- Remove the main units from the base parts.

(3.3 Mounting controllers) ➤ 3-6

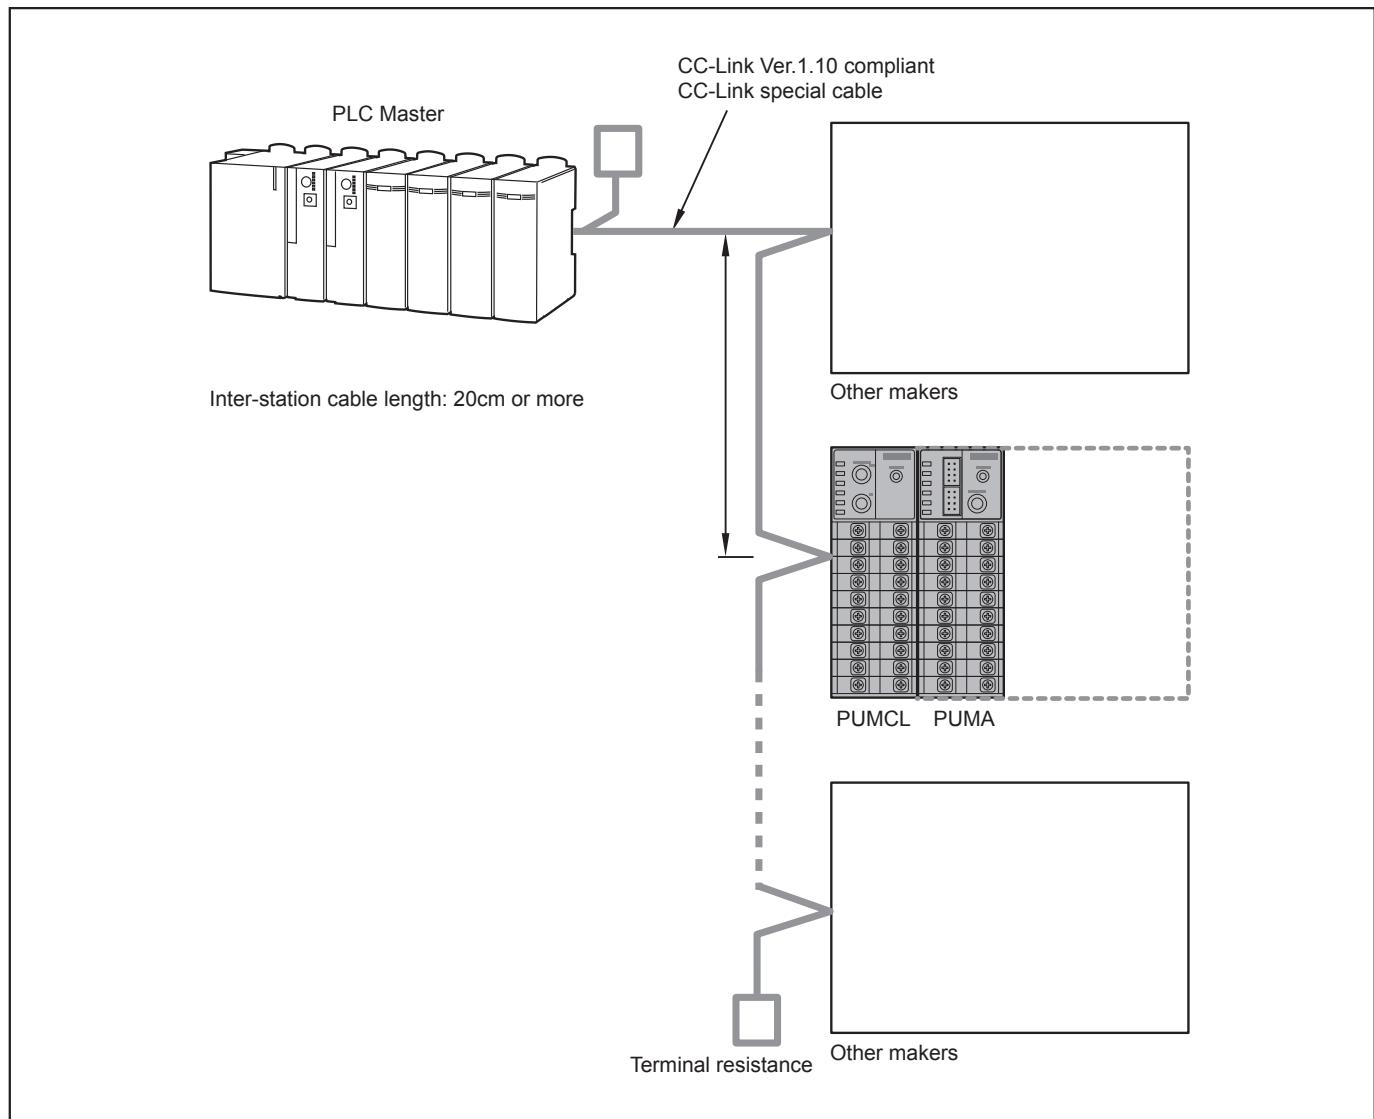

- Connect base parts. Push up to fasten all the locking tabs.
- Fixate the base parts onto the mounting position inside the cabinet with screws.
- Attach the main units to the base parts.

3.6 Connection

CC-Link connection

Make CC-Link connection for PUM series temperature control system via this equipment.

- This equipment comes to be the CC-Link station, and PUM series occupies 4 of 64 stations.
- Make a multi-drop connection to PLC (master) with using CC-Link ver.1.10 compliant CC-Link special cable.
- Terminal resistances are necessary for the both end of CC-Link communication line.

Note

To prevent damage and failure of the equipment, wiring after turning OFF the power of this equipment and peripheral equipment.

Point

- CC-Link special cable is not included in this product. Please prepare CC-Link Ver.1.10 compliant CC-Link special cable optionally.
- For the cable specifications, connecting method, and the makers, refer to the homepage of CC-Link Partner Association
Homepage address: <http://www.cc-link.org/>
- Communication speed and maximum transmission distance is shown below

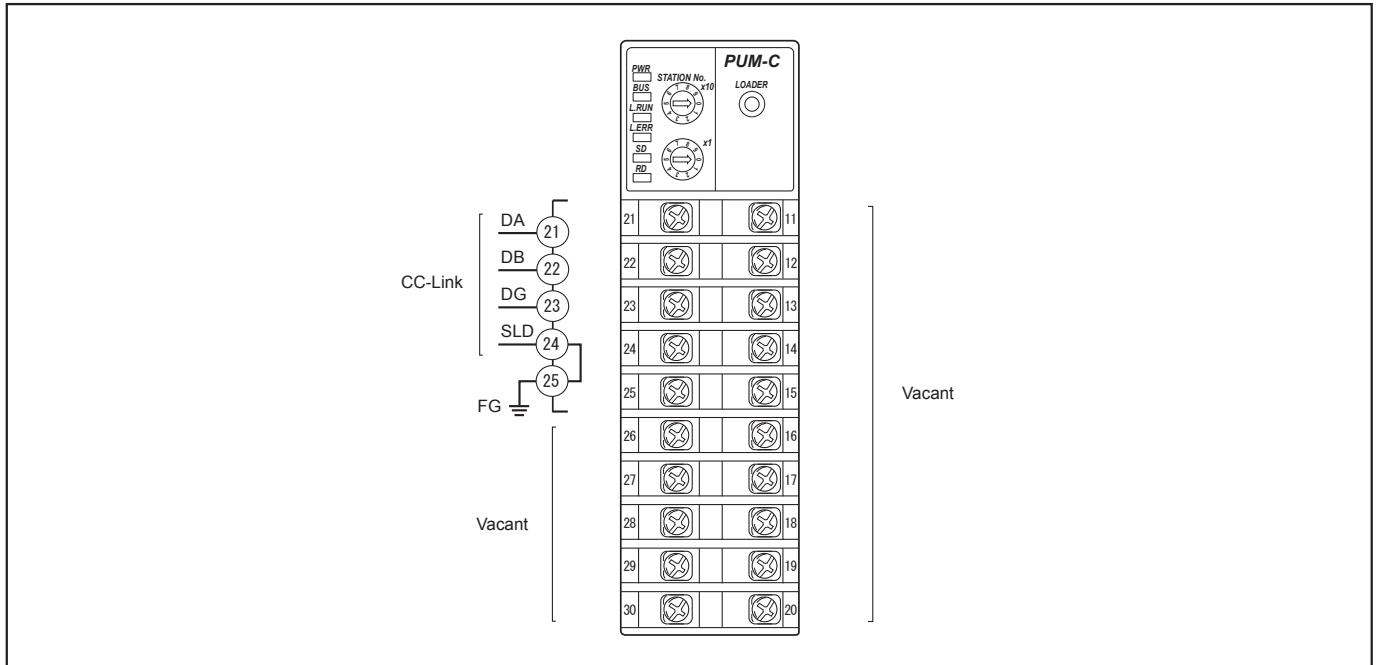

Communication speed and maximum transmission distance (when using Ver.1.10-compliant CC-Link special cable)

Communication speed setting	Inter-station cable length	Max. transmission distance (Max. length of network)
10Mbps	20cm or more	100m
5Mbps		160m
2.5Mbps		400m
625kbps		900m
156kbps		1200m

* About communication speed, please refer to "4.1 CC-Link communication setting".  4-3

* For more details, please refer to the CC-Link Cable Wiring Manual published by CC-Link Partner Association.

Terminal

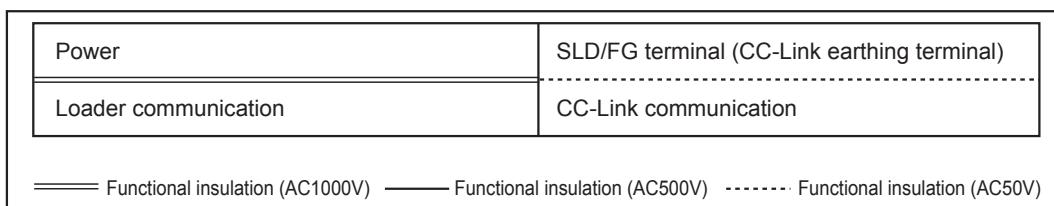

Terminal No.	Code	Cable color
21	DA	Blue
22	DB	White
23	DG	Yellow
24	SLD	Earthing conductor (Shield)
25	FG	-

Point

Communication terminal numbers and signal descriptions

- CC-Link communication terminal is not attachable/detachable online. For replacement of this equipment, you need to down the whole link. Also, Frame ground (FG), terminal No.25, is only for the functional FG of CC-Link, and not for the whole of PUM system.
- D-class grounding with ground resistance of 100Ω or less is required for both ends of the shielded line of CC-Link ver.1.10 compliant CC-Link special cable via each controller's SLD terminals and FG terminals.
- Do not share the shielded line to other equipments and use the line more than 20 mm^2 .
- Note that the insulation class for this equipment is as follows. Before installing, please confirm that the insulation class for the equipment meets usage requirements.

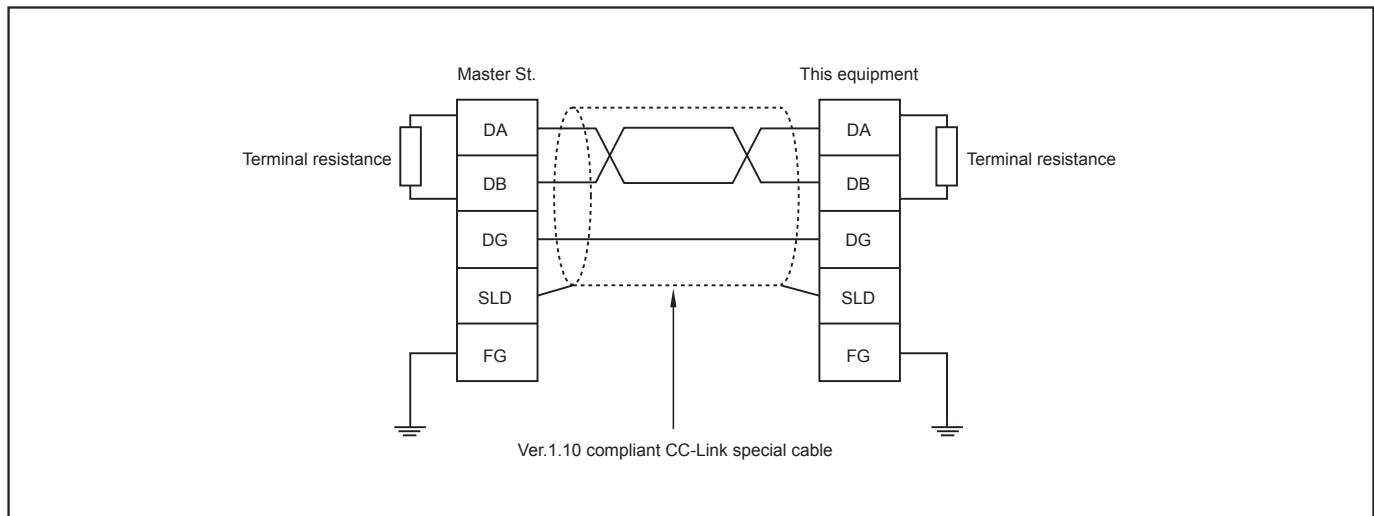

* For more details, please refer to the CC-Link Cable Wiring Manual published by CC-Link Partner Assosiation.

Connection of terminal resistance

Terminal resistances are required to both end of CC-Link communication line.

Connect the terminal resistances between DA and DB terminals.

Point

- Please use the terminal resistance of specifications shown below.

$110\Omega \pm 5\% 1/2W$

Connecting modules

The modules that can be connected to this equipment are follows.

- PUMA/B (Control module), PUMV/N/T (Analog I/O module), PUME (Event I/O module)

Point

- Maximum 32 units per this equipment are connectable. However, number of connectable units is depends on module types. Please refer to the user's manual for each module.
- When connected modules, if any one of connected controllers is directly connected with power supply, power will be provided to all of controllers via side connectors.

Note

Only PUMA/B (control module) can be accessed from the host PLC via CC-Link communication.

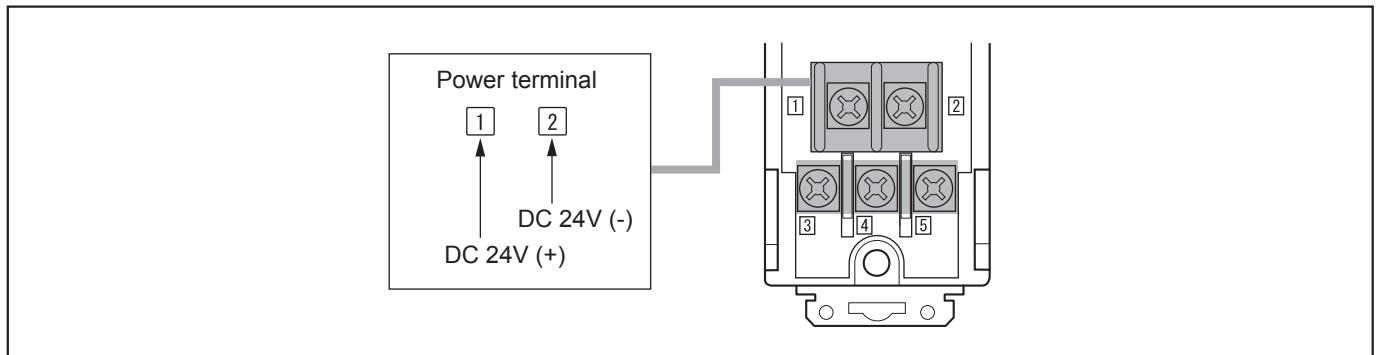

Wiring for power supply

Terminal layout

Power terminal is on the base part of each controller.

The terminal layout of all controllers is the same.

Power supply is connected to connected controllers via side connectors if one controller is directly connected to them.

Note

- For wiring to the terminal block, apply crimp type terminals size M3.

Make sure to use screws included in this product only.

Screw size : M3 x 7 (with square washer)

Screw tightening torque : 0.78N•m (8kgf•cm)

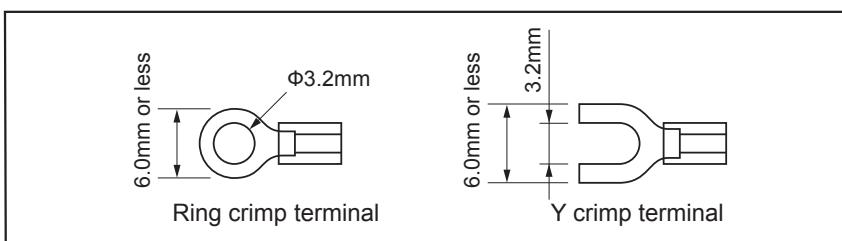

- Apply power cable with allowable current capacity larger than the total consumption current of all connected controllers.
- For wiring to power terminal, do not apply more than two cables to one terminal.
(Power cable should be connected to power terminal directly from the power unit.)
- Please prepare power cables and crimp terminals of the size indicated below.

Power cable

Cable type	Size
Thermocouple (Compensation lead wire)	1.25mm ² or less
Power supply	1.25mm ² or less

Crimp terminal

Cable size	Screw tightening torque
0.25 to 1.25mm ²	0.8 N•m

3.6 Connection

4

Enhanced Communication Function Setting

4.1 CC-Link Communication Setting 4-3

1 Overview

2 System Configuration Example

3 Installation

4 Enhanced Communication Function Setting

5 Communication Devices

6 Troubleshooting

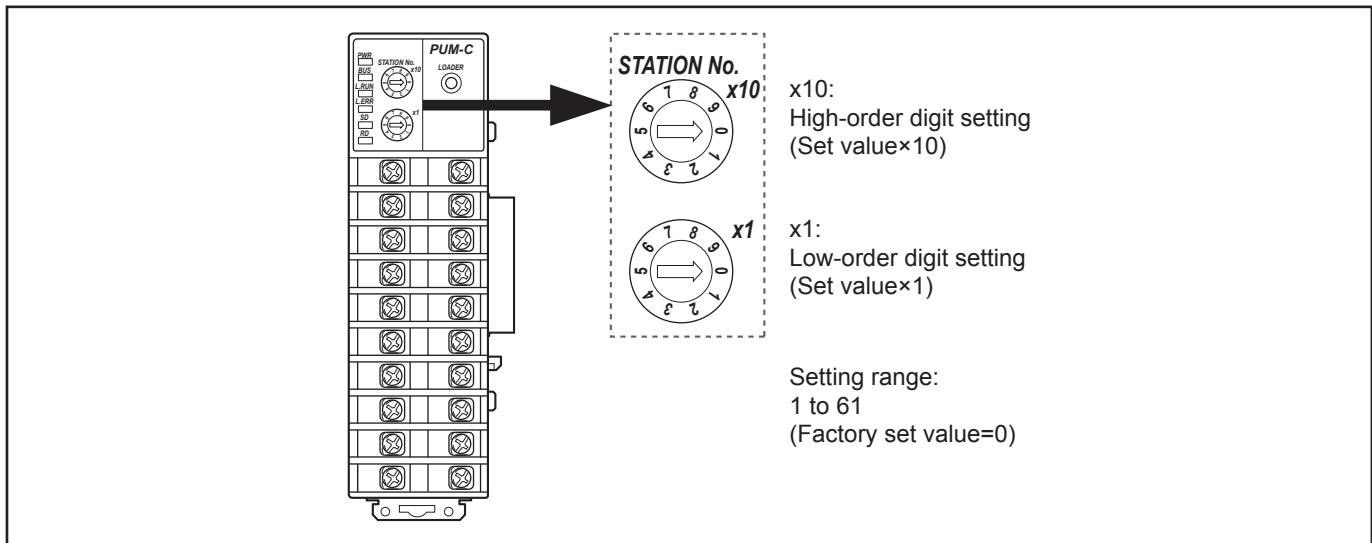

4.1 CC-Link Communication Setting

In order to perform communication between PUM module (remote device station) and PLC (master station), setting of station numbers and communication speed is necessary.

CC-Link station number setting

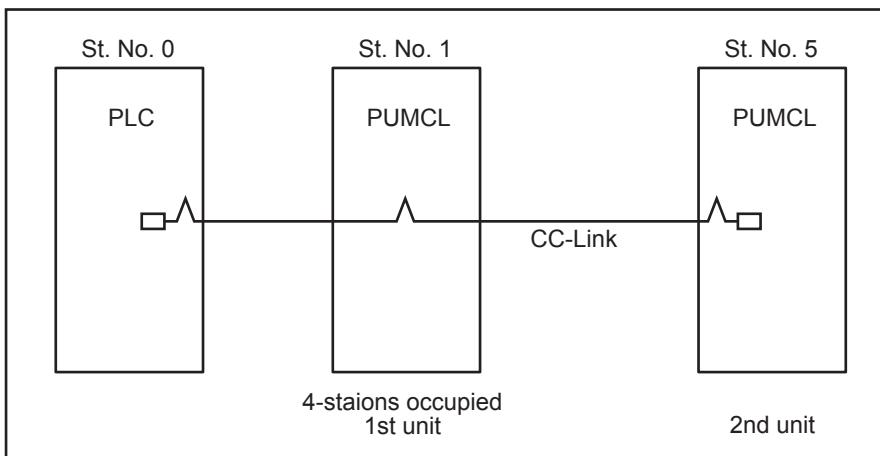

With CC-Link station number setting, station number is settable from "1" to "61".

Apply a fine tip flat-head screwdriver to turn the Station No. configuration switch.

Note

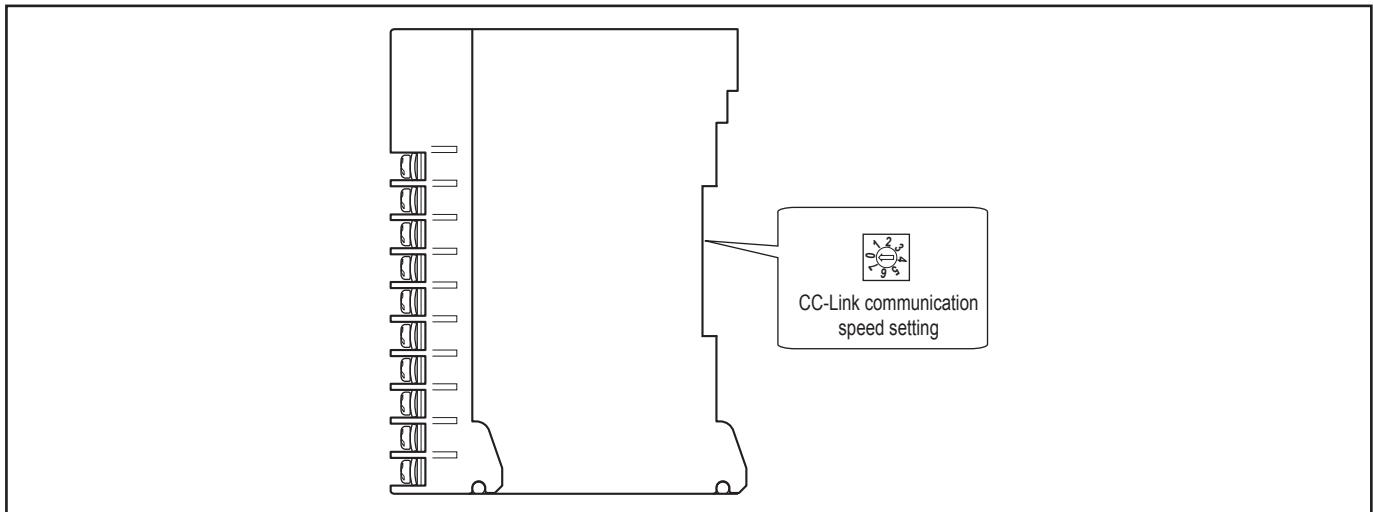

- If "0" or larger than "62" is selected, station number selection error occurs, and "L.ERR" LED will be ON.
- When more than one remote device is used as below, the assigned station number for the 2nd unit depends on occupied station numbers of the 1st unit. When 1st unit is 4-stations occupied and the station number is "1", station number,"5", is assigned to the 2nd unit.

CC-Link communication speed setting

Set the CC-Link communication speed by the station number configuration switch on the right of module's back face.

Switch setting with using a fine tip flat-head screwdriver and so on.

Communication speed and maximum transmission distance (When using ver.1.10-compliant CC-Link special cable)

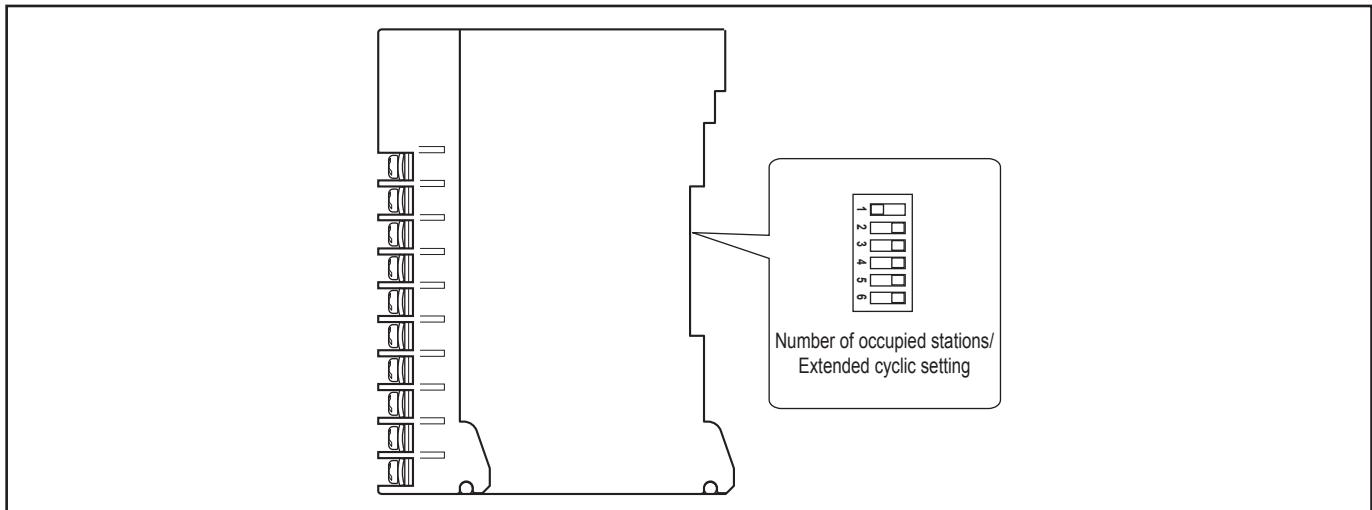

Communication speed setting	Communication speed	Maxi. transmission distance (Max. length of network)
0	156kbps	1200m
1	625kbps	900m
2	2.5Mbps	400m
3	5Mbps	160m
4	10Mbps	100m

Note

If "5" to "9" is selected, communication error occurs, and "L.ERR" LED will turn ON.

Number of stations occupied/Extended cyclic setting

Number of stations occupied /Extended cyclic is set by DIP switch (SW1 to SW4) on the left of back face of the main unit.

Select from 6 modes below.

SW1	SW2	SW3	SW4	Number of stations occupied/ Extended cyclic setting (Number of loop)	Compliant ver- sion
OFF	OFF	OFF	OFF	Setting for 4 stations occupied × 1 (8Ch)	Ver.1
ON	OFF	OFF	OFF	Setting for 4 stations occupied × 1 (16Ch)	
OFF	ON	OFF	OFF	Setting for 4 stations occupied × 2 (16Ch)	Ver.2
ON	ON	OFF	OFF	Setting for 4 stations occupied × 2 (32Ch)	
OFF	OFF	ON	OFF	Setting for 4 stations occupied × 4 (32Ch)	
ON	OFF	ON	OFF	Setting for 4 stations occupied × 4 (64Ch)	

Note

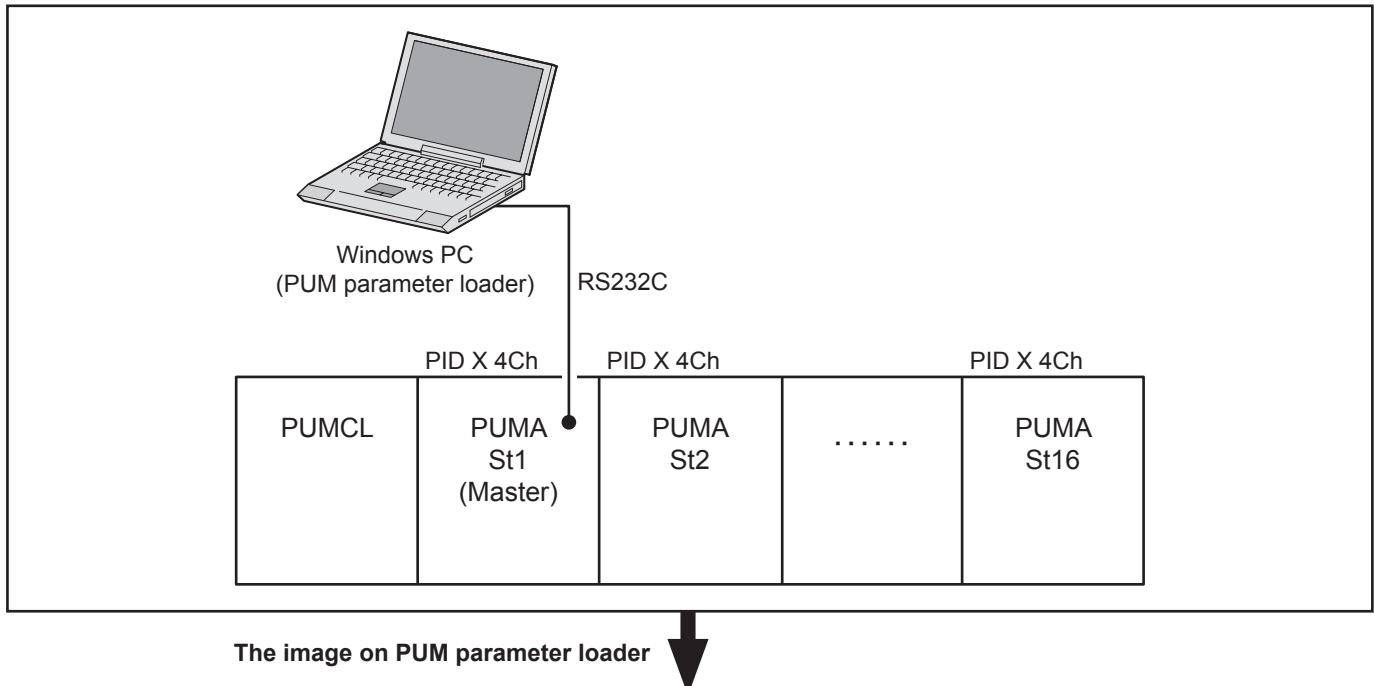

If the setting other than the above is set to DIP switch, "Setting for 4 stations occupied × 1 (8 Ch)" is set.

Channel allocation

Channel allocation is different between when using a loader communication port and when using CC-Link.

When connecting PC to the loader communication port and monitor by using PUM parameter loader

<Configuration of 4Ch module (General PID) is 16 units>

	St1				St2				...	St16			
	Ch1	Ch2	Ch3	Ch4	Ch1	Ch2	Ch3	Ch4		Ch1	Ch2	Ch3	Ch4
PV	○	○	○	○	○	○	○	○	...	○	○	○	○
MV (heating)	○	○	○	○	○	○	○	○	...	○	○	○	○
MV (cooling)	-	-	-	-	-	-	-	-	...	-	-	-	-

"1" to "4" Ch is allocated to per station, and each channel has data.

When connecting to PLC via CC-Link communication and monitoring

<Configuration of 4Ch module (General PID) is 16 units>

	St1				St2				...	St16			
	Ch1	Ch2	Ch3	Ch4	Ch5	Ch6	Ch7	Ch8		Ch61	Ch62	Ch63	Ch64
PV	○	○	○	○	○	○	○	○	...	○	○	○	○
MV (heating)	○	○	○	○	○	○	○	○	...	○	○	○	○
MV (cooling)	-	-	-	-	-	-	-	-	...	-	-	-	-

Channel is numbered serially starting from St.1 and has data per Ch1 to 64.

When connecting PC to the loader communication port and monitoring by using PUM parameter loader

<Mixed configuration of 2Ch module (General PID), 4Ch module (General PID), and 2Ch (Heating /cooling control) >

The image on the PUM parameter loader

	St1				St2				St3			
	Ch1	Ch2	Vacant	Vacant	Ch1	Ch2	Ch3	Ch4	Ch1	Ch2	Vacant	Vacant
PV	○	○	Vacant	Vacant	○	○	○	○	○	○	Vacant	Vacant
MV (heating)	○	○	Vacant	Vacant	○	○	○	○	○	○	Vacant	Vacant
MV (cooling)	-	-	Vacant	Vacant	-	-	-	-	○	○	Vacant	Vacant

1 to 2Ch or 1 to 4 Ch per station is allocated to a channel, and each channel has data.

If 2-Ch module exists, there will be vacant channels.

When connecting to PLC via CC-Link communication and monitoring

<Mixed configuration of 2Ch module (General PID), 4Ch module (General PID), and 2Ch module (Heating/cooling control) >

	St1				St2				St3			
	Ch1	Ch2	Vacant	Vacant	Ch5	Ch6	Ch7	Ch8	Ch9	Ch10	Vacant	Vacant
PV	○	○	Vacant	Vacant	○	○	○	○	○	○	Vacant	Vacant
MV (heating)	○	○	Vacant	Vacant	○	○	○	○	○	○	Vacant	Vacant
MV (cooling)	-	-	Vacant	Vacant	-	-	-	-	○	○	Vacant	Vacant

Channel is numbered serially starting from St.1, and has data per Ch1 to 64.

If 2-Ch module exists, there will be vacant channels.

5.1 Interface Overview of Master Station and PUMCL Module (Remote Device Station)

5.1 Interface Overview of Master Station and PUMCL Module (Remote Device Station)

PUMCL module (CC-Link), the remote device station, interfaces to PLC by using the remote input (RX) area, the remote output (RY) area, and the remote register (RWw, RWr) area.

Interface Overview

Remote output

Remote output is bit information to operate the remote device and to specify data operated in the remote register.

Main functions are shown below.

Signal	Descriptions
Extension number configuration for display data	Specify the extension number of data you desire to read from a remote device to a remote register
Extension number configuration for setting data	Specify the extension number you desire to write form a remote device to a remote register
Extended display flag	Execute reading
Extension configuration flag	Execute writing
Initial-related flag	Execute the operation for request/completion of initialization
RUN/STOP switch	Switch a control module operation (RUN/STOP)

Remote input

Remote input is bit information to describe the remote device conditions.

The main status display is shown below.

Signal	Descriptions
Alarm	Alarm escalated from a control module
Status	Status escalated from a control module
Extended display completion flag	Flag to inform the reading execution completion
Extension configuration completion flag	Flag to inform the writing execution completion
Initial-related flag	Initial demand/completion status
Error flag	Information about CC-Link communication

Remote register

Remote register is the word area to read/write into the remote device.

Data handled differs by number of stations occupied/extended cyclic setting.

For details, please refer to Remote Register on the next page.

Point

When the master station (PLC) is in the stop status, writing to the remote output (RY)/remote register (RWw) is not reflected in this equipment.

For detail information about communications, please refer to the instruction manual for PLC.

Remote Register

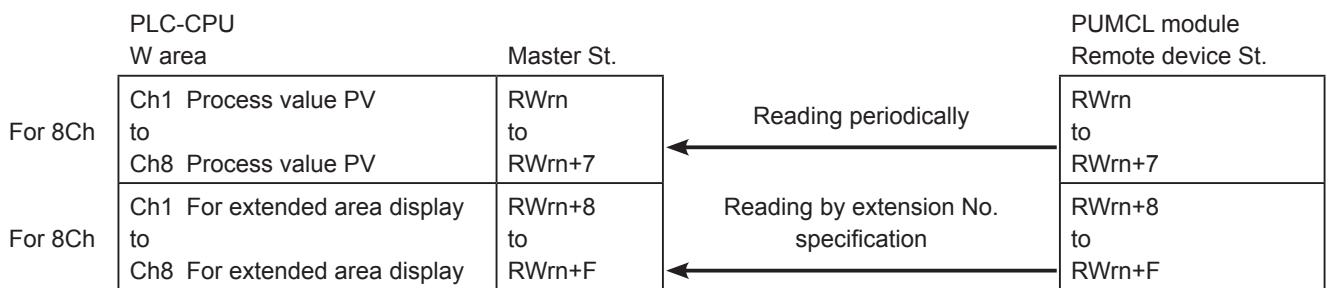

Use of the remote register differs by Setting for number of stations occupied/extended cyclic. The explanation below is the case of 4 stations occupied×1 setting.

4 stations occupied ×1 setting (8Ch)

Remote register (Read)

Transmission consists of two areas.

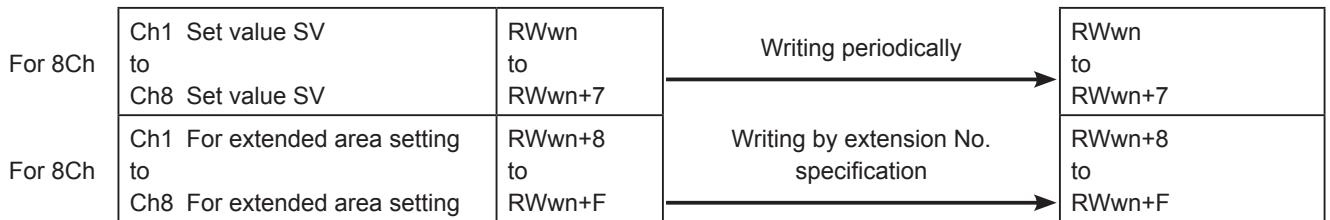

1. The area for being read PV value periodically.
2. The area for reading corresponding data to specified extension number. Extension number is specified by remote output (bit output).

Remote register (Write)

Transmission consists of two areas.

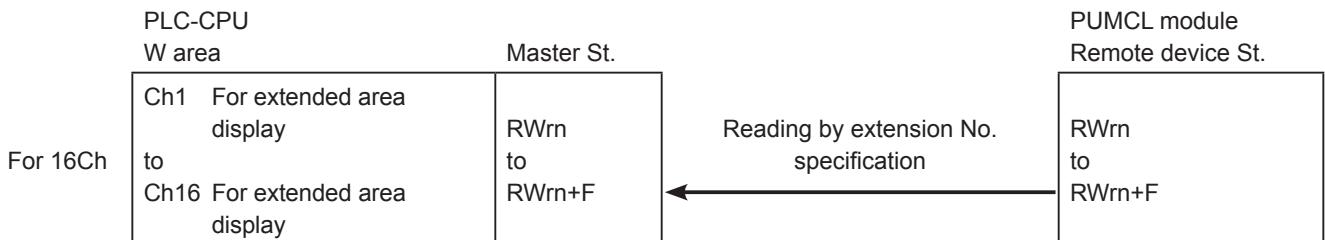

1. The area for writing SV value periodically.
2. The area for writing corresponding data to specified extension number. Extension number is specified by remote output (bit output).

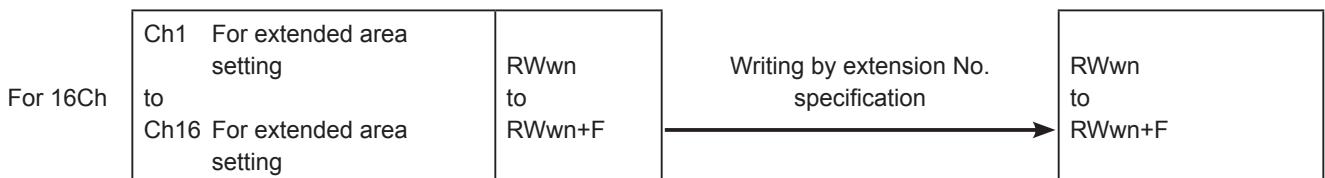

4 stations occupied ×1 setting (16Ch)

Corresponding data to the extension number specified by the all area is handled. The extension number is specified by remote output (bit output).

Remote register (Read)

Remote register (Write)

5.2 Data Handling Instructions

There are some cases with the numeric value (remote register) that obtained by sending / receiving to/from PUM module. The case are that the value has no decimal point, has decimal point, and minus.

Note

Do not access to the address not listed on the "5.6 List of Extension numbers".  5-57

When the value has no decimal point

If value has no decimal point, no change added.

Ex) Read out data when SV value is 100°C

Decimal number representation; 100 Hexadecimal number representation: 64H

When the value has a decimal point

If the numeric value has a decimal point, the decimal point is omitted.

Ex) The remote register read out value when the process value (PV) is 101.1°C

Decimal number representation: 1011 Hexadecimal representation: 03F3H

When the value is minus

If the numeric value is minus, minus is represented by complement representation of “2”.

It means the value is that subtracted the minus value from 10000H in the hexadecimal number.

Ex) Read out value when the process value (PV) is -1.1°C.

Decimal number representation: -11 Hexadecimal number representation: FFF5H (10000H-BH)

5.3 List of Remote Input /Output

Remote input (RX) and remote output (RY) are bit information.

Point

- "n" in the list is the address allocated to the master station by CC-Link station number setting.

"n" is calculated by using the following formula. However, this formula is used when designing the network with only our PUM modules and the all number of stations occupied / extended cyclic setting is the same.

Number of stations occupied / extended cyclic setting	Formula
4 stations occupied ×1 setting	$n = \frac{(\text{St. No.} - 1) \times 32}{16}$
4 stations occupied ×2 setting	$n = \frac{(\text{St. No.} - 1) \times 56}{16}$
4 stations occupied ×4 setting	$n = \frac{(\text{St. No.} - 1) \times 112}{16}$

Because the calculation results are represented by decimal numbers, convert it to hexadecimal numbers prior to assign it to "n" in the list.

Ex) PUM module setting is 4 stations occupied × 1 and the station number is "5".

$$n = \frac{(5-1) \times 32}{16} = 8 \text{ (decimal number)}$$

$$= 8 \text{ (hexadecimal number)}$$

If the St. No. is 5: Remote input RXn0 to RX (n+7) F → RX80 to RXFF

Remote output RYn0 to RY (n+7) F → RY80 to RYFF

- The data of the channel other than the channels used is nonuse.

Note

If connecting several PUM of 4 stations occupied, the station numbers are not serial such as, 1, 5, 9.

4 stations occupied ×1 setting

5.4 List of Remote Register

Remote register (RW_r, RW_w) are numeric values.

point

- "n" in the list is address allocated to the master station by CC-Link station number setting.

"n" is calculated by using the following formula. However, this formula is used when designing the network with only our PUM modules and the all number of stations occupied / extended cyclic setting is the same.

Number of stations occupied / extended cyclic setting	Formula
4 stations occupied × 1 setting	$n = (\text{St. No.} - 1) \times 4$
4 stations occupied × 2 setting	$n = (\text{St. No.} - 1) \times 8$
4 stations occupied × 4 setting	$n = (\text{St. No.} - 1) \times 16$

Because calculation results are represented by decimal numbers, convert them to hexadecimal numbers prior to assign them to "n" in the list.

Ex) PUM module setting is 4 stations occupied × 1 and the station number is "5".

$$n = (5-1) \times 4 = 16 \text{ (decimal number)} \rightarrow 10 \text{ (hexadecimal number)}$$

If the St. No. is 5: Remote register RW_rn to RW_rn +F → RW_r10 to RW_r1F

RW_wn to RW_wn +F → RW_w10 to RW_w1F

- The data of the channel other than the used channels is nonuse.

Note

If connecting several PUM of 4 stations occupied, the station numbers are not serial such as, 1, 5, 9.

4 stations occupied ×1 setting (8Ch allocation)

Extension No. data specified by extension No.
configuration for setting data, RYn6 to RYnB and
RY (n+1) 8 to RY (n+1) B.

5.5 Extension Number Setting

Communication items dealt with in the extended area of remote register (RWr, RWw) are specified by extension numbers. Extension number is the number specified by remote output in order to select data dealt with in the remote register. Select necessary data in the list of extension numbers, and set that extension number on the remote output, it will be able to be handled for remote register (RWr, RWw).

About remote register, please refer to "5.4 List of Remote Register" ▶ 5-39

About extension numbers, please refer to "5.6 List of Extension Numbers" ▶ 5-57

When read out data (Extension number configuration for display)

Extension number for display is set by remote output, RYn0 to RYn5 and RY (n+1) 0 to RY (n+1) 7.

Bit image

RY (n+1) 7	RY (n+1) 6	RY (n+1) 5	RY (n+1) 4	RY (n+1) 3	RY (n+1) 2	RY (n+1) 1	RY (n+1) 0
bit13	bit12	bit11	bit10	bit9	bit8	bit7	bit6

RYn5	RYn4	RYn3	RYn2	RYn1	RYn0
bit5	bit4	bit3	bit2	bit1	bit0

Bit data: 0(OFF), 1(ON) [Decimal number representation: 0 to 1023]

When write data (Extension number configuration for setting)

Extension number for setting is set by remote output, RYn6 to RYnB and RY (n+1) 8 to RY (n+1) F.

Bit image

RY (n+1) F	RY (n+1) E	RY (n+1) D	RY (n+1) C	RY (n+1) B	RY (n+1) A	RY (n+1) 9	RY (n+1) 8
bit13	bit12	bit11	bit10	bit9	bit8	bit7	bit6

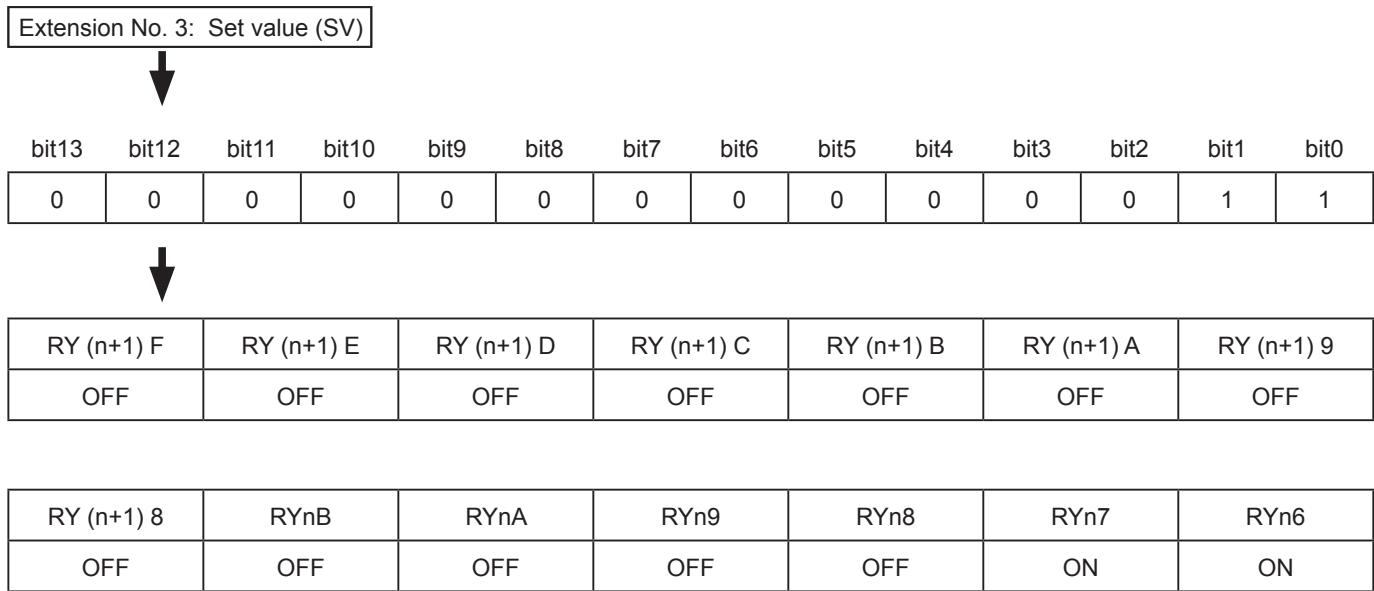

RYnB	RYnA	RYn9	RYn8	RYn7	RYn6
bit5	bit4	bit3	bit2	bit1	bit0

Bit data: 0(OFF), 1(ON) [Decimal number representation: 0 to 1023]

5.5 Extension Number Setting

Ex) When set [3] set value (SV) to the extension number for setting

Number of stations occupied/extended cyclic setting: 4 stations occupied ×1 setting

Bit data: 0 (OFF), 1 (ON)

5.6 List of Extension Numbers

Figure of extension numbers for CC-Link communication module (0-511)

Extension No.	Attribute	Contents	Read/Write data setting range	Factory set value
0	RO	Process value (PV)	-5-105%FS	—

Further notes on the data of extension numbers list

Further notes on the list are shown below.

PV input type

The setting limits of input range and decimal point position according to the input type set value are as follows.

Input type		Input code	Measurable range	Decimal point position setting limit
			[°C]	[°C]
Resistance bulb	JPT100Ω	0	0 to 150	1
		1	-150 to 600	1
	Pt100Ω	2	0 to 150	1
		3	-150 to 300	1
		4	-150 to 850	1
		5	0 to 400	1
Thermocouple	J	6	0 to 800	1
		7	0 to 400	1
	K	8	0 to 800	1
		9	0 to 1200	0
		10	0 to 1600	0
	B	11	0 to 1800	0
	S	12	0 to 1600	0
	T	13	-199 to 400	1
	E	14	-199 to 800	1
	N	18	0 to 1300	0
	PL-II	19	0 to 1300	0
DC voltage	DC0-5V	21	-1999 to 9999	2
	DC1-5V	22		2
	DC0-10V	23		2
	DC2-10V	24		2

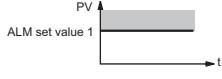

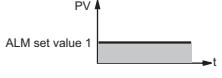

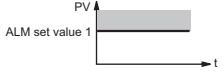

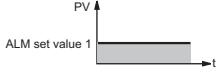

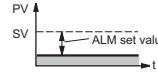

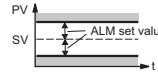

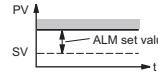

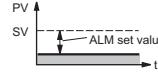

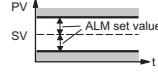

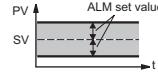

DO output event type setting

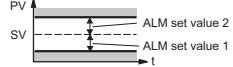

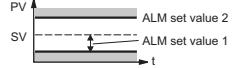

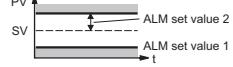

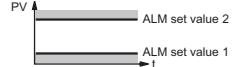

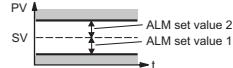

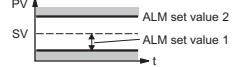

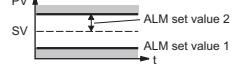

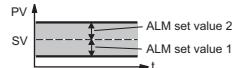

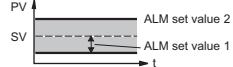

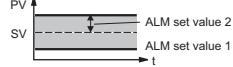

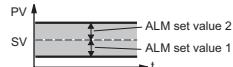

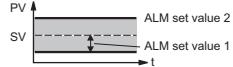

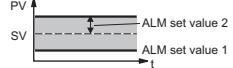

Select the event number for the DO output event type from the table below.

- No event

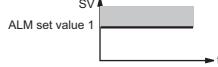

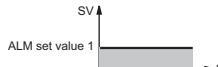

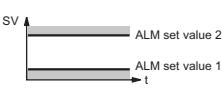

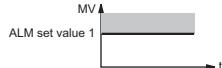

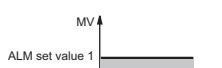

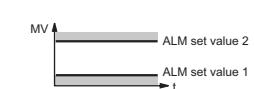

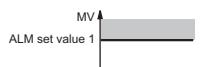

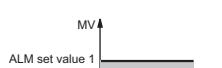

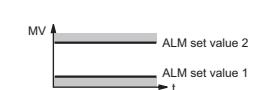

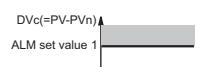

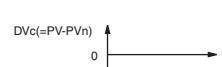

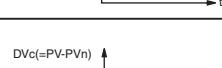

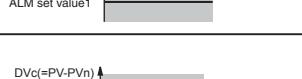

Event category	Event No.	Event type	Behavior diagram
—	0	OFF	—

- Alarm event

Event category	Event No.	Event type	Behavior diagram
PV absolute alarm	1	Upper limit absolute	
	2	Lower limit absolute	
	3	Upper limit absolute with hold	
	4	Lower limit absolute with hold	
Deviation alarm	5	Upper limit deviation	
	6	Lower limit deviation	
	7	Upper/lower limit deviation	
	8	Upper limit deviation with hold	
	9	Lower limit deviation with hold	
	10	Upper/lower limit deviation with hold	
Range alarm1	11	Range upper/lower limit deviation	

Event category	Event No.	Event type	Behavior diagram
Upper / lower limit alarm	16	Upper/lower limit absolute	
	17	Upper/lower limit deviation	
	18	Upper limit absolute, lower limit deviation	
	19	Upper limit deviation, lower limit absolute	
	20	Upper/lower limit absolute with hold	
	21	Upper/lower limit deviation with hold	
	22	Upper limit absolute, lower limit deviation with hold	
	23	Upper limit deviation, lower limit absolute with hold	
Range alarm 2	24	Range upper/lower limit absolute	
	25	Range upper/lower limit deviation	
	26	Range upper limit absolute, lower limit deviation	
	27	Range upper limit deviation, lower limit absolute	
	28	Range upper/lower limit absolute with hold	
	29	Range upper/lower limit deviation with hold	
	30	Range upper limit deviation, lower limit absolute with hold	
	31	Range upper limit absolute, lower limit absolute with hold	

5.6 List of Extension Numbers

	36	MV lower limit (heat)	
	37	MV upper/lower limit (heat)	
	38	MV upper limit (cool))	
	39	MV lower limit (cool)	
	40	MV upper/lower limit (cool)	
Interchannel PV deviation alarm	41	Interchannel upper limit deviation	
	42	Interchannel lower limit deviation	
	43	Interchannel upper/lower limit deviation	
	44	Interchannel upper limit deviation with hold	
	45	Interchannel lower limit deviation with hold	
	46	Interchannel upper/lower limit deviation with hold	

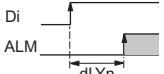

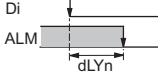

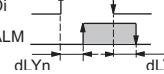

Event category	Event No.	Event type	Behavior diagram
Break/short-circuit alarm	61	Loop break alarm	—
	64	CT[A] HB alarm	—
	65	CT[B] HB alarm	—
	66	CT[A] HB alarm or CT[B] HB alarm	—
	67	CT[A] load short-circuit alarm	—
	68	CT[B] load short-circuit alarm	—
	69	CT[A] load short-circuit alarm or CT[B] load short-circuit alarm	—

Point

- When selecting an event type with either of upper limit or lower limit only, the event always refers to "ALM set value 1".
- Event No.11 detects whether both negative and positive deviation between PV and SV is within the range of "ALM set value1". Event No.13 detects whether deviation between PV and SV is within "ALM set value1" on the positive side and "ALM set value 2" on the negative side.

5.6 List of Extension Numbers

- Events other than alarms

Event category	Event No.	Event type	Behavior diagram
Timer code	52	ON delay timer	
	53	OFF delay timer	
	54	ON/OFF delay timer	
Condition output	71	During auto-tuning	—
	72	Normal Operation	—
	73	Standby	—
	74	Manual Mode operating	—
	75	Remote SV operating	—
	76	During ramp SV	—

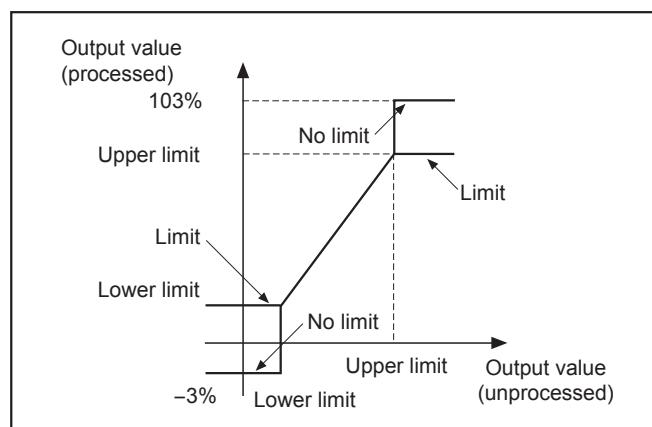

Relevant parameters

- ALM set value1/ ALM set value2
- Event delay time
- Event delay time unit
- ALM hysteresis
- DO option

Output limiter type setting

Set value	MV1		MV2	
	Lower limits	Upper limits	Lower limits	Upper limits
0	-3.0%	103%	-3.0%	103%
1	Lower limits	103%	-3.0%	103%
2	-3.0%	Upper limits	-3.0%	103%
3	Lower limits	Upper limits	-3.0%	103%
4	-3.0%	103%	Lower limits	103%
5	Lower limits	103%	Lower limits	103%
6	-3.0%	Upper limits	Lower limits	103%
7	Lower limits	Upper limits	Lower limits	103%
8	-3.0%	103%	-3.0%	Upper limits
9	Lower limits	103%	-3.0%	Upper limits
10	-3.0%	Upper limits	-3.0%	Upper limits
11	Lower limits	Upper limits	-3.0%	Upper limits
12	-3.0%	103%	Lower limits	Upper limits
13	Lower limits	103%	Lower limits	Upper limits
14	-3.0%	Upper limits	Lower limits	Upper limits
15	Lower limits	Upper limits	Lower limits	Upper limits

The output changes according to the limit, as follows.

5.7 CC-Link Flag Operation

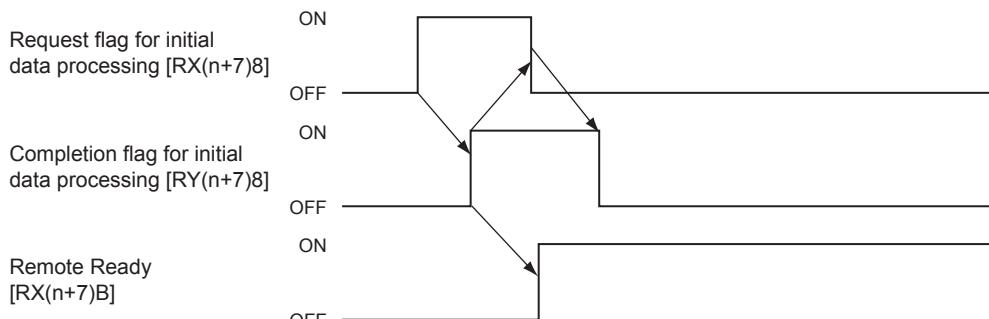

Flag operations for remote input/output or remote register are shown below.

Ex) When the setting for number of stations occupied/extended cyclic is 4-stations occupied ×1 (8Ch allocation)

Request for initialization when the power is on

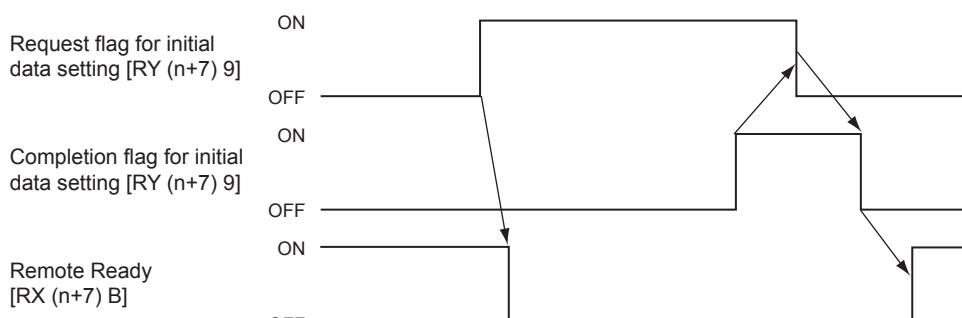

Request for initialization by the remote device station (PUM module)

When the power is on, initialization is completed on PUM module, and then the request flag for initial data processing [RX (n+7) 8] will be ON. As a result, turn ON the completion flag for initial data processing [RY (n+7) 8]. [RX (n+7) 8] will be OFF. When the PUM module comes to be in the ready status, remote ready [RX (n+1) B] will be ON.

Request for initial setting by the master station (PLC)

This is the request for initial setting from the master station to PUM module. Since there is any initial data especially, no process is necessary.

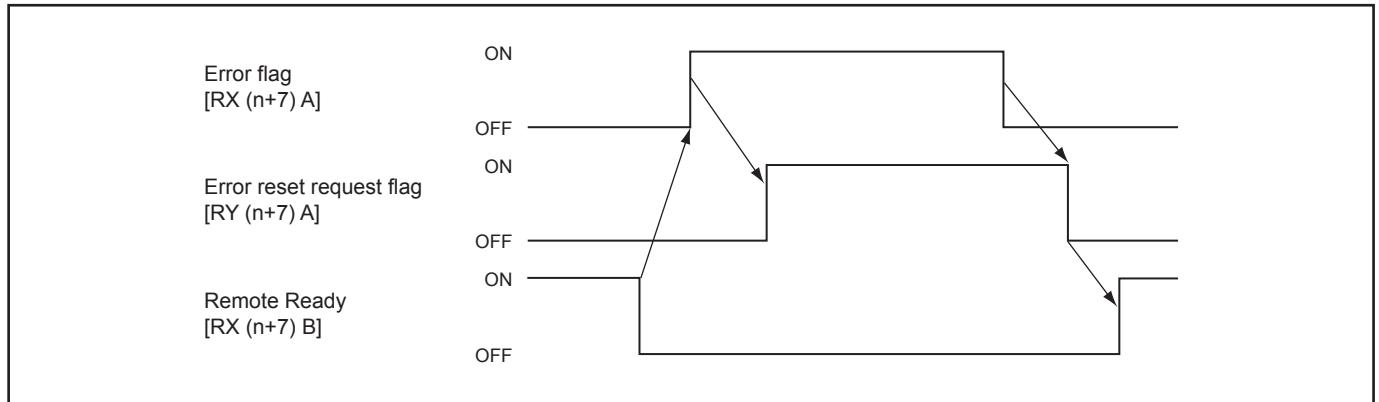

Error flag/Error reset

If the error flag [RX (n+7) A] is ON, error codes are stored in the remote register.

If the request flag for error reset [RY (n+7) A] will be ON when error occurs, [RX (n+7) A] comes to be OFF to clear the error code.

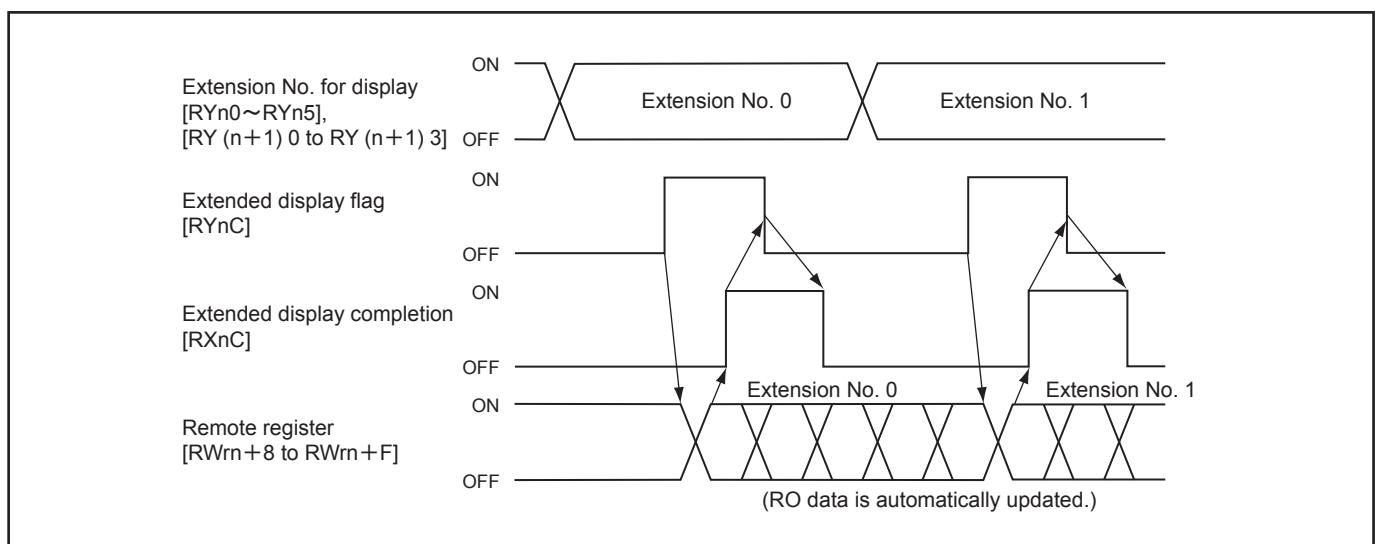

If switch [RY (n+7) A] to OFF after that, remote ready comes to be ON.

Switch the extension number for display

Switch the content of extended display for remote register.

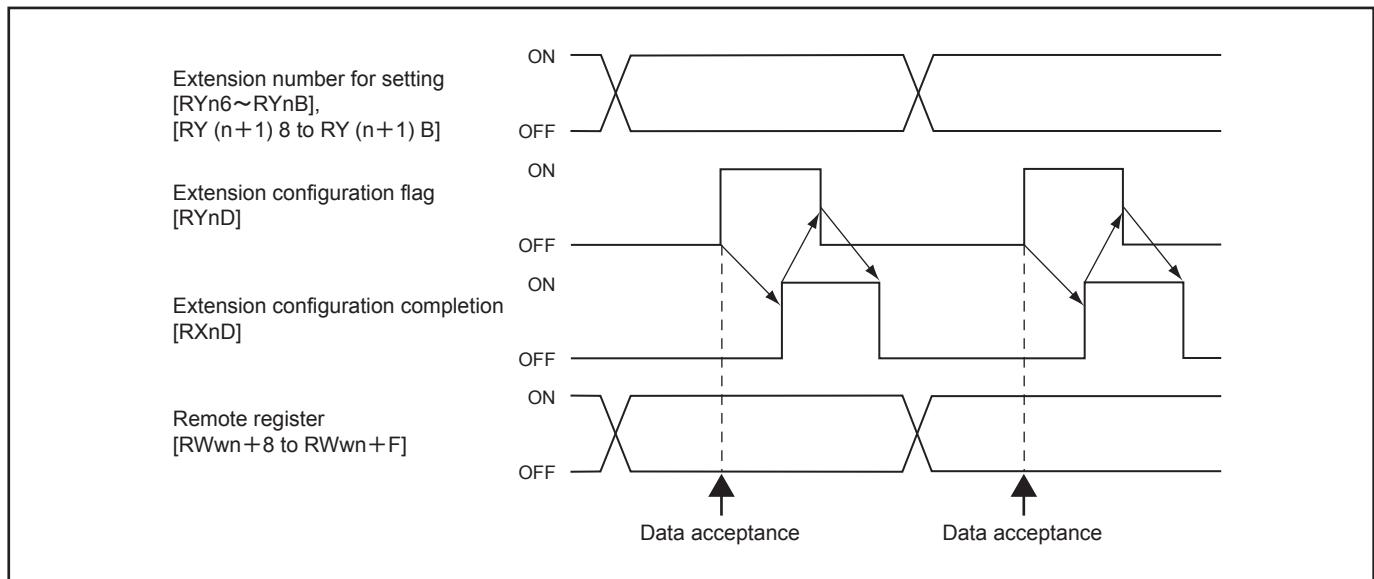

After setting the extension number for display [Ryn0 to Ryn5] and [RY (n+1) 0 to RY (n+1) 3], switch the extended display flag [RYnC] to ON. Then, check that data display of the remote register [RWrn + B to RWrn +F] will end, and extended display completion [RXnC] comes to be ON, prior to switch OFF the extended display flag [RYnC]. When the extended display flag [RYnC] comes to be OFF, the extended display completion [RXnC] will be OFF.

Switch the extension number for setting

Switch the content of extension configuration for remote register and change the set value.

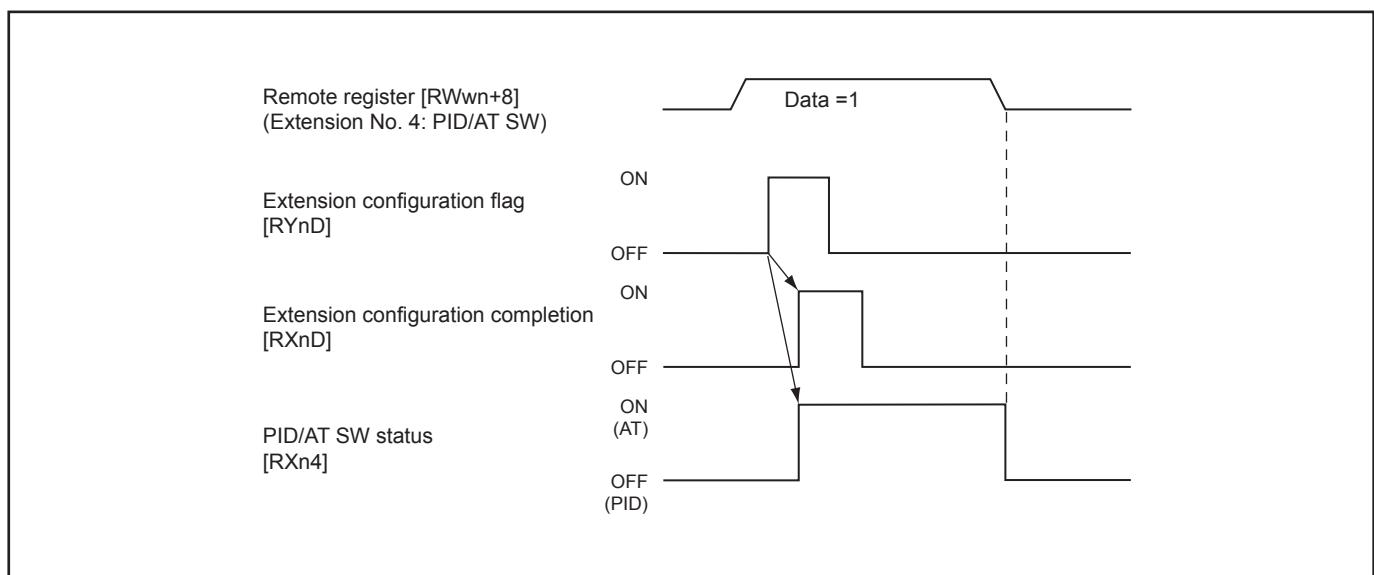

After setting the extension number for setting [RYn6 to RYnB] and [RY (n+1) 8 to RY (n+1) B], switch the extension configuration flag [RYnD] ON. Then, check that the contents of remote register [RWwn + 8 to RWwn +F] will end, and extension configuration completion [RXnD] comes to be ON, prior to switch OFF the extension configuration flag [RYnD]. When the extension configuration flag [RYnD] comes to be OFF, the extension configuration completion [RXnD] will be OFF.

Start AT (Example of Channel 1)

Switch processing of extension number for setting by writing [1] to the remote register [RWwn +8].

When AT command is received, PID/AT switch status [RXn4] comes to be ON and get into AT status. When finish AT, [RXn4] switches OFF and the remote register will back to "0".

5.8 Sample program

A sample program for reading and writing data that runs on Mitsubishi sequencer, MELSEC, is distributed in our home page.

The sample program is meant to be used as a reference for your own program creation, and therefore all its actions are not guaranteed.

Sample program body can be downloaded from our home page indicated below.

Home page address: <http://www.fic-net.jp/> CC-Link sample PG_V10

Sequencer design / maintenance tool

GX Developer Version 8.30G

Sequencer

MELSEC series (Q00CPU)

Note

- GX Developer Version 8.30G is the registered trademark of Mitsubishi Electric Corporation.

Troubleshooting

6.1 Troubleshooting procedures.....6-3

1 Overview

2 System Configuration Example

3 Installation

4 Enhanced Communication Function Setting

5 Communication Devices

6 Troubleshooting

6.1 Troubleshooting procedures

6.1 Troubleshooting procedures

The following table lists troubles that may occur during communication and those solutions.

Troubles	Causes	Solutions
Read/Write on the control module is not available despite the fact that Remote Ready signal is ON. (Green PWR lamp of the control module is lighted)	Communication permission setting is incorrect.	Set communication permission setting of modules other than CC-Link module to "connected" and restart.
Read/Write on the control module is not available despite the fact that Remote Ready signal is ON. (Red PWR lamp of the control module is lighted)	Internal communications between modules are in the abnormal status.	<p>Improve PWR lamp from red to green. <About LED indicator display> "PWR" indicator of the module LED that connected laterally might come to be red by one of the following status.</p> <ul style="list-style-type: none"> • More than 2 out of modules connected laterally, which have the same St. No. • More than 2 out of modules connected laterally, which are set "Master/slave setting for internal communications between modules" to "0: Master". • The module that has the St. No. set to the output master St. or DI input master St. is nonexistent.
Data is not updated.	Faulty wiring of CC-Link cables	Check CC-Link wiring.
	Miscompare of communication speed setting	Check the communication speed of PLC and the communication module. (St. No. configuration SW)
	Miscompare setting of number of stations occupied/extended cyclic	Check the PLC soft definition and communication module DIP SW.
	Incorrect setting of communication St. No.	Check communication module St. No is in the 1 to 61 range, and 1 is set to the first unit.
Hardware error flag is ON.	MODBUS communication error occurred	<p>Check that the modules other than CC-Link are connected firmly.</p> <ul style="list-style-type: none"> • Connection part of modules' lateral connection. (Connection among backboard) • Connection of the main unit and backboard. <p>Check if something wrong with the modules' hardware other than CC-Link.</p>
